

# Integrated multistandard comb filter

## SAA4961

### FEATURES

- One chip adaptive multistandard comb filter
- Time discrete but continuous amplitude signal processing with analog interfaces
- Internal delay lines, filters, clock processing and signal switches
- Alignment-free
- No hanging dots or residual cross colour on vertical transients
- Few external components.

### GENERAL DESCRIPTION

The SAA4961 is an adaptive alignment-free one chip comb filter compatible with both PAL and NTSC systems and provides high performance in Y/C separation.

### QUICK REFERENCE DATA

## Integrated multistandard comb filter

SAA4961

**FUNCTIONAL DESCRIPTION****Functional requirements**

The multistandard comb filter processes the video standards PAL B, G, H, M, N and NTSC M. PAL D and I signals can also be processed but with the drawback of a slightly reduced bandwidth.

For SECAM and SVHS signals the input signals can be bypassed to the output without processing by selecting the BYPASS-mode.

A sync separation circuit is incorporated to generate control signals for the internal clock processing. With a sync compression of up to 12 dB the sync separator works properly (see Fig.4).

The IC is controlled via six pins:

1. BYP forces the IC into the BYPASS-mode (comb filter function off)
2. SSYN defines whether the COMB-mode is entered synchronously or not and defines the polarity of the BYP pin
3. SYS1 selects the video standard
4. SYS2 selects the video standard
5. FSCSW selects the reference frequency  $f_{sc}$  or  $2 \times f_{sc}$
6. LPFION enables the internal pre-filter.

It is possible to select the following modes of operation:

COMB-mode: luminance and chrominance comb filter function active if BYPASS-mode not active.

BYPASS-mode: signal processing not active, all clocks inactive,  $C_{ext}$  (pin 10) is bypassed to  $C_O$  (pin 12) and  $Y_{ext}/CVBS$  (pin 17) is bypassed to  $Y_O$  (pin 14) and CVBSO (pin 15). This mode is forced via BYP (pin 3).

If the stimulus of the mode is changed, the IC is following the new mode after the stabilization time given in Table 1.

**Table 1** Stabilization time after mode change

MODE CHANGE	MAXIMUM STABILIZATION TIME
COMB-mode to BYPASS-mode	1 line
BYPASS-mode to COMB-mode	1 field

The mode change from BYPASS to COMB depends on SSYN (pin 6) and can be asynchronous or synchronous related to the vertical pulse. The mode change from COMB to BYPASS is always performed asynchronously.

**Pin description****FSC (PIN 1)**

Input for the reference frequency  $f_{sc}$  (see note 2 of Chapter "Characteristics") or  $2 \times f_{sc}$ . For SECAM standard signals the best signal performance in BYPASS-mode is achieved by switching the FSC input signal off externally.

**BYP (PIN 3)**

Input signal that controls the operation mode. A low-pass filter is added to the input for suppression of subcarrier frequencies. Thus applications are supported where the operation mode (COMB or BYPASS) is controlled by the DC-level of the FSC input signal at pin 1. For those applications the BYP input can be externally connected to FSC (pin 1).

Depending on SSYN (pin 6) the function of BYP can be adapted to a certain application with respect to the polarity of the logic level and with respect to the behaviour when entering the COMB-mode.

Depending on SSYN the BYP input can be either inverted or non-inverted with the function as shown in Table 2.

**Table 2** Bypass function

SSYN	BYP	SELECTED MODE
LOW	LOW	COMB-mode
LOW	HIGH	BYPASS-mode
HIGH	LOW	BYPASS-mode
HIGH	HIGH	COMB-mode

Depending on SSYN the behaviour when entering the COMB-mode is different for the both selectable logic polarities while the BYPASS-mode is always entered asynchronously (immediately).

**Table 3** Behaviour when entering the COMB-mode

SSYN	ENTERING COMB-MODE
LOW	immediately if BYP = LOW
HIGH	synchronized by vertical pulse if BYP = HIGH

The PLL and the clock processing are always stopped if the selected level for BYPASS is applied to BYP (independent of the vertical pulse).

## Integrated multistandard comb filter

## SAA4961

## REFBP (PIN 5)

Decoupling capacitor for the band-pass filter reference voltage.

## SSYN (PIN 6)

Input signal that controls the function of BYP (pin 3).

 $V_{CCA}$ ,  $V_{CCO}$ ,  $V_{DDD}$  AND  $V_{CCPLL}$  (PINS 7, 8, 22 AND 27)

Supply voltages.

## AGND, OGND, DGND AND PLLGND (PINS 9, 11, 21 AND 26)

Ground connection. AGND is used as signal reference for all analog input and output signals.

 $C_{ext}$  (PIN 10)

Input for an external chrominance signal which is correlated to the external VBS signal.

 $C_O$  (PIN 12)

Chrominance output signal. This output can be switched between the comb filtered chrominance from the CVBS signal and the external chrominance signal from the input  $C_{ext}$  if the IC is forced into BYPASS-mode.

**Table 4**  $C_O$  output signal

MODE	$C_O$ OUTPUT SIGNAL
COMB	comb filtered chrominance signal
BYPASS	external chrominance signal of $C_{ext}$ input

## FSCSW (PIN 13)

Input signal to select between  $f_{sc}$  or  $2 \times f_{sc}$  as reference at the FSC input pin.

**Table 5** Reference frequency selection

FSCSW	SELECTED REFERENCE
HIGH	$2 \times f_{sc}$
LOW	$f_{sc}$

 $Y_O$  (PIN 14)

VBS output signal. This output can be switched between the comb filtered luminance signal (including synchronization) and the external (C)VBS signal from the input  $Y_{ext}/CVBS$ . In COMB-mode the output signal is delayed by 2 lines (1 line at NTSC) and by an additional processing delay.

**Table 6**  $Y_O$  output signal

MODE	$Y_O$ OUTPUT SIGNAL
COMB	comb filtered luminance signal
BYPASS	external CVBS signal of $Y_{ext}/CVBS$ input

## CVBSO (PIN 15)

CVBS output signal directly from the input in BYPASS-mode or delayed by the signal processing time of 2 lines (1 line at NTSC) and an additional processing delay.

**Table 7** CVBSO output signal

MODE	CVBSO OUTPUT SIGNAL
COMB	delay compensated CVBS signal
BYPASS	external CVBS signal of $Y_{ext}/CVBS$ input

 $Y_{ext}/CVBS$  (PIN 17)

Input for the CVBS signal or for an external VBS signal.

## LPFION (PIN 18)

Input signal to disable the internal pre-filter LPFI.

**Table 8** Pre-filter mode

LPFION	SELECTED MODE
LOW	LPFI inactive
HIGH	LPFI active
Floating	LPFI active

## CSY (PIN 19)

Sync top capacitor for the sync separator.

## Integrated multistandard comb filter

## SAA4961

SYS1 AND SYS2 (PINS 20 AND 23)

System switch input signals to adapt the signal processing to the different CVBS standards.

**Table 9** System switch input signals

SYS1	SYS2	STANDARD
LOW	LOW	PAL M
LOW	HIGH	PAL B, G, H, D and I; note 1
HIGH	LOW	NTSC M
HIGH	HIGH	PAL N

### Note

1. The standard PAL B, G, H, D and I is internally preset as default.

REFDL (PIN 24)

Decoupling capacitor for the delay line reference voltage.

COMBENA (PIN 25)

Output signal that indicates the current mode of operation. This output is forced to LOW if the comb filter is in BYPASS-mode.

**Table 10** Mode of operation

COMBENA	SELECTED MODE
LOW	BYPASS-mode; PLL and clock processing stopped
HIGH	COMB-mode

### Internal functional description

#### SWITCHED CAPACITOR DELAY LINE

Delays the CVBS input signal by 2 lines and 4 lines (all PAL standards) or by 1 line and 2 lines (NTSC standard). Input signals for the delay lines are the CVBS signal, the clock CL3 ( $3 \times f_{sc}$ ), the control signal HSEL and the standard selection signal SYSPAL.

Output signals are the non-delayed, the 2-line delayed and the 4-line delayed CVBS signal (PAL) or the 1-line delayed and the 2-line delayed CVBS signal (NTSC).

#### SWITCHED CAPACITOR BAND-PASS FILTERS (BPFs)

The comb filter input BPFs attenuate the low frequencies to guarantee a correct signal processing within the logical comb filter.

The comb filter output BPF reduces the alias components that are the result of the non-linear signal processing within the logical comb filter.

#### LOGICAL COMB FILTER

Separates the chrominance from the band-pass filtered CVBS signal.

#### COMPENSATION DELAY

Compensates the internal processing time of the band-pass filters and the logical comb filter section.

#### ADDER

The comb filtered luminance output signal is obtained by adding the delayed CVBS signal and the inverted comb filtered chrominance signal.

#### LOW-PASS FILTER INPUT (LPFI)

Analog input low-pass filter to reduce the outband frequencies of EMC. The input low-pass filter is included in the signal path but it can be switched off via the input signal LPFION.

#### LOW-PASS FILTER OUTPUTS (LPFO1 AND LPFO2)

Two different types of output low-pass filters (LPFO1 and LPFO2) are necessary to get equal signal delays within the luminance path and the chrominance path (important for good transient behaviour). The low-pass output filter type LPFO1 is used for the luminance output while LPFO2 is used for the chrominance output. The filters are analog 3rd order elliptic low-pass filters that convert the output signals from the time discrete to the time continuous domain (reconstruction filter).

#### LPF CONTROL

Automatic tuning of the low-pass filters is achieved by adjusting the filter delays. The control information for all filters (CONT1 and CONT2) is derived from a built-in reference filter (LPFO1-type) that is part of a control loop. The control loop tunes the reference filter delay and thus all other filter delays to a time constant derived from the system clock CL3.

#### CONTROL AND CLOCK PROCESSING (CLOCK CONTROL)

The control and clock processing block (see Fig.9) consists of the sub-blocks PLL, the clock processing and the mode control. The PLL and the clock processing are released for operation if the input level at BYP selects the COMB-mode.

## Integrated multistandard comb filter

SAA4961

Main tasks of the control and clock processing are:

- Clock generation of system clock CL3
- Delay line start control
- Mode control.

The signal processing is based on a  $3 \times f_{sc}$  system clock (CL3), that is generated by the clock processing from the  $f_{sc}$  signal at FSC (pin 1) via a PLL. Because the subcarrier frequency divided by the line frequency results not in an integer value a clock phase correction of  $180^\circ$  is necessary every second line for PAL standards or every line for NTSC standard. The clock phase correction is controlled by the input signals horizontal sync. Additionally the delay line start is synchronized once a field to the input signals horizontal sync. The 25 Hz PAL offset is corrected in this way.

The PLL provides a master clock MCK of  $6 \times f_{sc}$ , which is locked to the subcarrier frequency at FSC (pin 1).

The system clock CL3 ( $3 \times f_{sc}$ ) is obtained from MCK by a divide-by-two circuit. The  $180^\circ$  phase shift is generated by stopping the divide-by-two circuit for one MCK clock cycle.

The generated clock is a pseudo-line-locked clock that is referenced to  $f_{sc}$ . The sync separator generates the necessary signals  $H_{DET}$  and  $V_{DET}$  indicating the line (H) and the field (V) sync periods.

The current mode of operation (BYPASS or COMB) is external readable via COMBENA (pin 25).

The input signals of the control and clock processing (CLOCK CONTROL) are:

$H_{DET}$ : analog horizontal pulse from sync separator

$V_{DET}$ : analog vertical pulse from sync separator

FSC: subcarrier frequency ( $f_{sc}$  or  $2 \times f_{sc}$ )

FSCSW: reference frequency selection

BYP: BYPASS control signal

SSYN: vertical synchronous mode selection for BYP and polarity selection of BYP.

The output signals are:

CL3: system clock ( $3 \times f_{sc}$ )

HSEL: line start signals for the delay lines

STOPS: forces the comb filter via the switches S2A, S2B and S2C into the BYPASS-mode (always asynchronous) or COMB-mode (synchronous or asynchronous with  $V_{INT}$ ; depending on SSYN)

COMBENA: HIGH during COMB-mode; otherwise LOW.

**Table 11** Function of STOPS signal

STOPS-STATE	SELECTED MODE
LOW	COMB
HIGH	BYPASS

### HORIZONTAL AND VERTICAL SYNC SEPARATOR

A built-in sync separator circuit generates the  $H_{DET}$  and  $V_{DET}$  signals from the  $Y_{ext}/CVBS$  input signal. This circuit is still operating properly at input signals with a 12 dB attenuated sync in a normal 700 mV black-to-white video signal (see Fig.4).

### CLAMP

The black level clamping of the video input signal is performed by the sync separator stage. The clamping level is nearly adequate to the voltage at REF DL (pin 24).

### SIGNAL SWITCH S1

The switch is included to bypass the low-pass input filter.

For the CVBS input of the delay line block two signals can be selected via the slow signal switch S1.

**Table 12** Function of signal switch S1

LPFION-STATE	DELAY LINE INPUT
LOW	non-pre-filtered input signal $Y_{ext}/CVBS$
HIGH	pre-filtered input signal $Y_{ext}/CVBS$
Floating	pre-filtered input signal $Y_{ext}/CVBS$

### SIGNAL SWITCH S2A

For the CVBSO output two signals can be selected via the signal switch S2A.

**Table 13** CVBSO output signal

STOPS-STATE	CVBSO OUTPUT SIGNAL	MODE
LOW	delayed input CVBS DL	COMB
HIGH	non-delayed input $Y_{ext}/CVBS$	BYPASS

### SIGNAL SWITCH S2B AND S2C

Two switches are included to bypass the comb filter signal processing. The input video signal  $C_{ext}$  for the switch S2C is internally biased.

## Integrated multistandard comb filter

SAA4961

For the  $Y_O$  output two signals can be selected via S2B (see Table 14).

For the  $C_O$  output two signals can be selected via S2C (see Table 15).

**Table 14**  $Y_O$  output signal

STOPS-STATE	$Y_O$ OUTPUT SIGNAL	MODE
LOW	YCOMB (combed luminance)	COMB
HIGH	input $Y_{ext}$ /CVBS	BYPASS

**Table 15**  $C_O$  output signal

STOPS-STATE	$C_O$ OUTPUT SIGNAL	MODE
LOW	CCOMB (combed chrominance)	COMB
HIGH	input $C_{ext}$	BYPASS

**LIMITING VALUES**

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
$V_{CC}$	supply voltage		–	6.5	V
$V$	input voltage protection threshold	except pin 1	–0.3	$V_{CC} + 0.3$	V

### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

#### Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg\ max}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

#### Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

### DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

### LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
