### description

The TC236P is a frame-transfer, charge-coupled device (CCD) image sensor designed for use in single-chip color NTSC TV, computer, and special-purpose applications requiring low cost and small size.

The image-sensing area of the TC236P is configured into 500 lines with 680 elements in each line. Twenty-two elements are provided in each line for dark reference. The blooming-protection feature of the sensor is based on an advanced lateral-overflow-drain concept. The sensor can be operated in a true-interlace mode as a 658(H) × 496(V) sensor with a low dark current. One important feature of the TC236P very high-resolution sensor is the ability to capture a full 340,000 pixels per field. The image sensor also provides high-speed image-transfer capability. This capability allows for a continuous electronic-exposure control without the loss of sensitivity and resolution inherent in other technologies. The charge is converted to signal voltage at 13  $\mu$ V per electron by a high-performance structure with a reset and a voltage-reference generator. The signal is further buffered by a low-noise, two-stage, source-follower amplifier to provide high output-drive capability.

The TC236P is built using TI-proprietary advanced virtual-phase (AVP) technology, which provides devices with high blue response, low dark current, high photoresponse uniformity, and single-phase clocking. The TC236P is characterized for operation from  $-10^{\circ}\text{C}$  to  $45^{\circ}\text{C}$ .

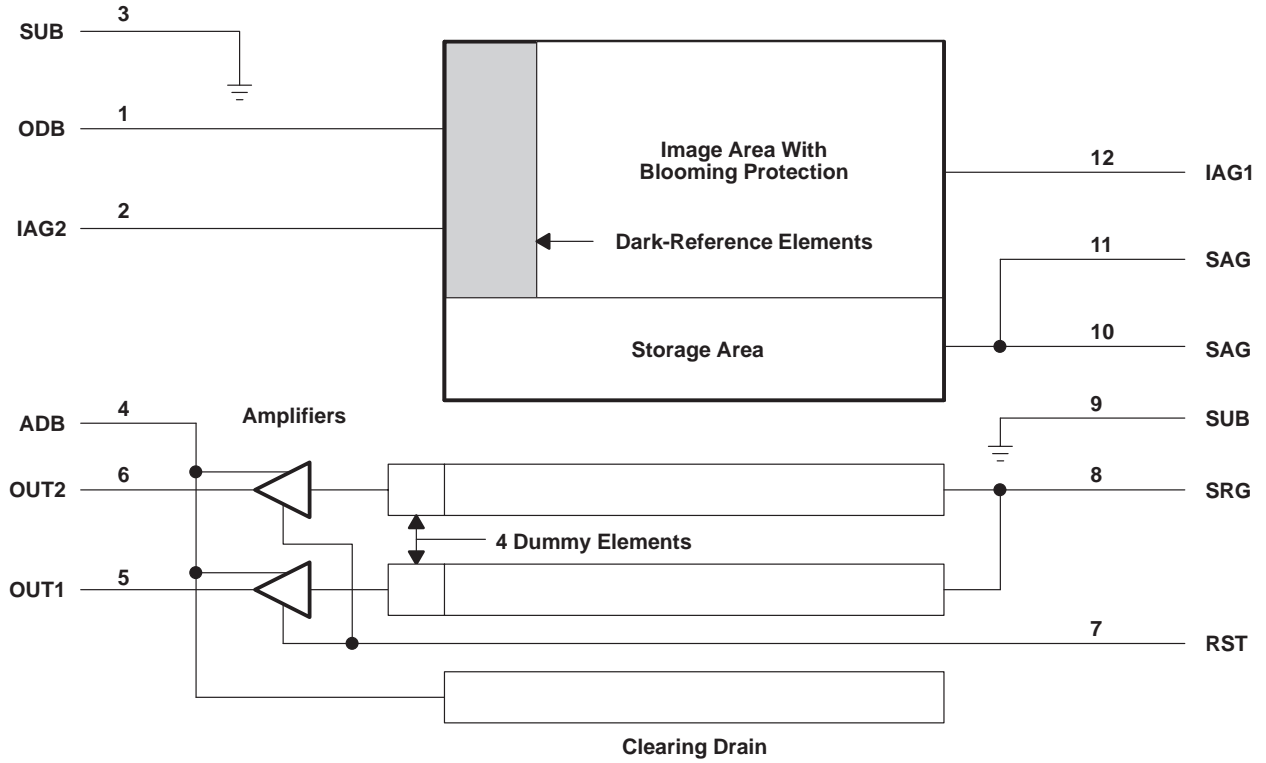

This MOS device contains limited built-in gate protection. During storage or handling, the device leads should be shorted together or the device should be placed in conductive foam. In a circuit, unused inputs should always be connected to  $V_{SS}$ . Under no circumstances should pin voltages exceed absolute maximum ratings. Avoid shorting OUT to  $V_{SS}$  during operation to prevent damage to the amplifier. The device can also be damaged if the output terminals are reverse-biased and an excessive current is allowed to flow. Specific guidelines for handling devices of this type are contained in the publication *Guidelines for Handling Electrostatic-Discharge-Sensitive (ESDS) Devices and Assemblies* available from Texas Instruments.

### Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
ADB	4	I	Supply voltage for amplifier-drain bias
IAG1	12	I	Image-area gate 1
IAG2	2	I	Image-area gate 2
ODB	1	I	Supply voltage for overflow-drain antiblooming bias
OUT1	5	O	Output signal 1
OUT2	6	O	Output signal 2
RST	7	I	Reset gate
SAG	10, 11	I	Storage-area gate
SRG	8	I	Serial-register gate
SUB	3, 9		Substrate

#### detailed description

The TC236P consists of four basic functional blocks: the image-sensing area, the image-storage area, the serial-register gates, and the low-noise signal-processing amplifier block with charge-detection nodes and independent resets. The location of each of these blocks is identified in the functional block diagram.

#### image-sensing and storage areas

Figure 1 and Figure 2 show top views of the image-sensing and storage-area elements. As light enters the silicon in the image-sensing area, free electrons are generated in both wells and collected in the virtual wells of the sensing elements. The color sensitivity is obtained by manufacturing a mosaic color filter directly onto the photosites of the image-sensing area (see Figure 3 for a mapping of the filter topology). Blooming protection is provided by applying a dc bias to the overflow-drain bias pin. If it is necessary to clear the image before beginning a new integration time (for implementation of electronic fixed shutter or electronic auto-iris), it is possible to do so by applying a pulse that is at least 1  $\mu$ s in duration to the overflow-drain bias. After integration is complete, the charge is transferred into the storage area; the transfer timing is dependent on whether the readout mode is interlace or progressive scan. If the progressive-scan readout mode is selected, the readout may be performed normally with one register or high speed by using both registers (see Figure 6 through Figure 8 for the interlace and progressive-scan readout modes).

There are 22 columns at the left edge of the image-sensing area that are shielded from incident light; these elements provide the dark reference used in subsequent video-processing circuits to restore the video black level. There are also four dark lines between the image-sensing and the image-storage area that prevent charge leakage from the image-sensing area into the image-storage area.

### spurious nonuniformity specification

The spurious nonuniformity specification of the TC236P is based on several sensor characteristics:

- Amplitude of the nonuniform pixel
- Polarity of the nonuniform pixel
  - Black
  - White
- Column amplitude

The CCD sensor is characterized in both an illuminated condition and a dark condition. In the dark condition, the nonuniformity is specified in terms of absolute amplitude as shown in Figure 4. In the illuminated condition, the nonuniformity is specified as a percentage of the total illumination as shown in Figure 5.

The specification for the TC236P is as follows:

WHITE SPOT (DARK)	WHITE SPOT (ILLUMINATED)	LOW-LEVEL WHITE SPOT (OVER 3.5 mV)	PEAK WHITE BLEMISH (OVER 3 mV)	OPTICAL GRAININESS	COLUMN (DARK)	BLACK SPOT (ILLUMINATED)
x < 15 mV	x < 30%	x < 1000	None	None	x < 0.5 mV	x < 30%

The conditions under which this specification is defined are as follows:

1. The integration time is 1/60 second except for illuminated white spots and illuminated black spots; and in these cases, the integration time is 1/240 second.
2. The temperature is 45°C.
3. The CCD video-output signal is 60 mV ± 10 mV.

† This readout is from register 2.

**Figure 7. Progressive-Scan Timing Diagram With Single-Register Readout**

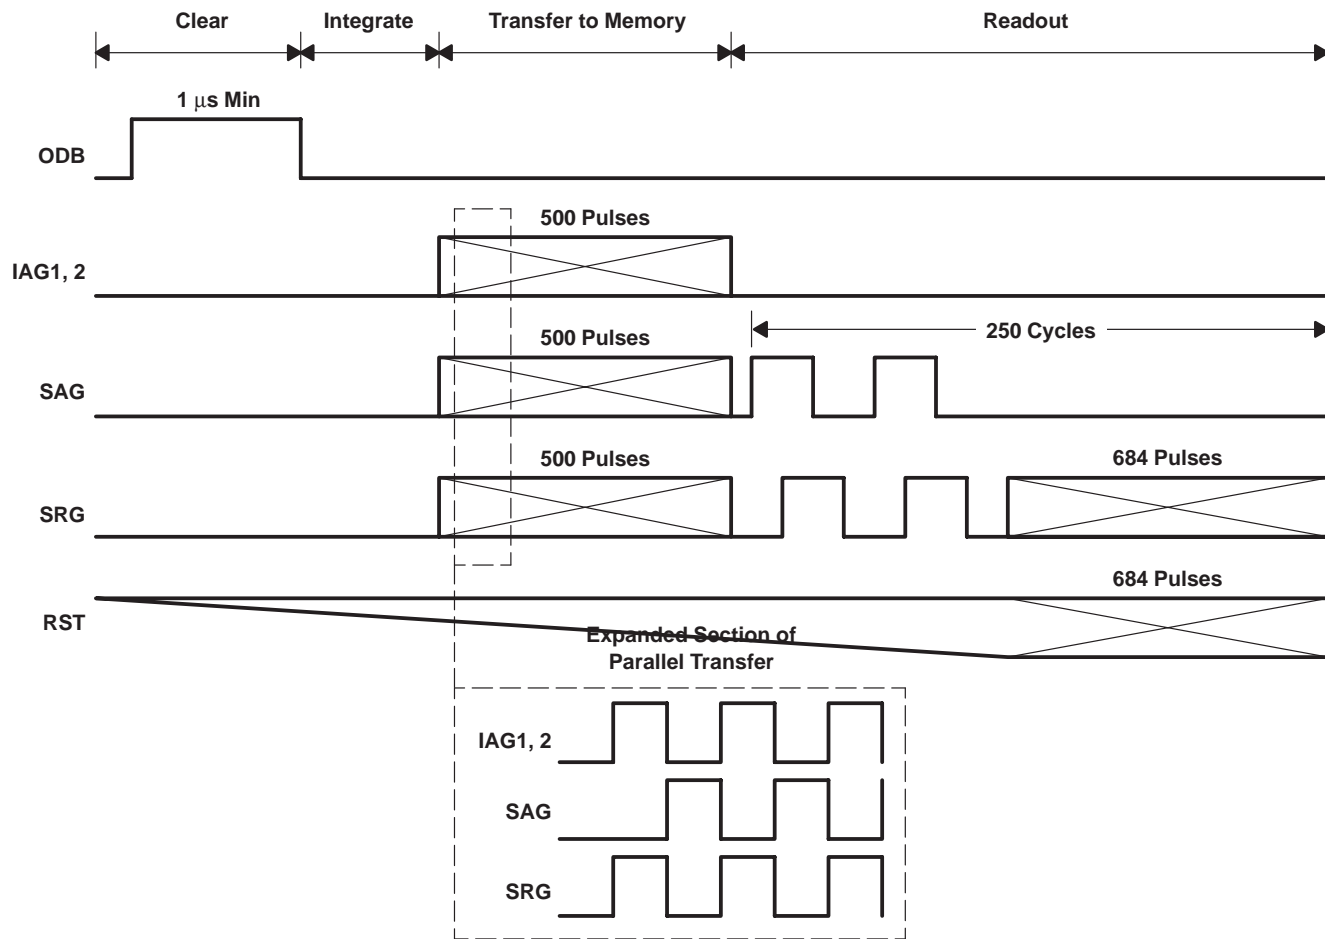

Figure 8. Progressive-Scan Timing Diagram With Dual-Register Readout

### serial registers

The storage-area gate and serial gate(s) are used to transfer the charge line by line from the storage area into the serial register(s). Depending on the readout mode, one or both serial registers is used. If both are used, the registers are read out in parallel.

### readout and video processing

After transfer into the serial register(s), the pixels are read out and placed onto a charge-detection node. The node must be reset to a reference level before the next pixel is placed onto the detection node. The timing for the serial-register readout, which includes the external pixel clamp and sample-and-hold signals needed to implement correlated double sampling (CDS), is shown in Figure 9. As the charge is transferred onto the detection node, the potential of this node changes in proportion to the amount of signal received. The change is sensed by an MOS transistor and, after proper buffering, the signal is supplied to the output terminal of the image sensor. The buffer amplifier converts charge into a video signal. Figure 10 shows the circuit diagram of the charge-detection node and output amplifier. The detection nodes and amplifiers are placed a short distance away from the edge of the storage area; therefore, each serial register contains four dummy elements that are used to span the distance between the serial registers and the amplifiers.

SOCS055A – JUNE 1996 – REVISED APRIL 1997

### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, $V_{CC}$ : ADB (see Note 1) .....	SUB to SUB + 15 V
ODB .....	SUB to SUB + 21 V
Input voltage range, $V_I$ : ABG, IAG1, IAG2, SAG, SRG .....	0 V to 15 V
Operating free-air temperature range, $T_A$ .....	-10°C to 45°C
Storage temperature range, $T_{stg}$ .....	-30°C to 85°C
Operating case temperature range .....	-10°C to 55°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to substrate terminal.

### recommended operating conditions

		MIN	NOM	MAX	UNIT	
Supply voltage, $V_{CC}$	ADB	21	22	23	V	
	ODB	Standard	15	16		17
		For clearing	25	26		27
Substrate bias voltage			10		V	
High-level input voltage, $V_{IH}$	IAG1, IAG2, SAG, SRG	11.5	12	12.5	V	
Low-level input voltage, $V_{IL}$	IAG1, IAG2, SAG, SRG		0		V	
Clock frequency, $f_{clock}$	IAG1, IAG2, SAG, SRG		12.5		MHz	
Load capacitance	OUT1, OUT2			6	pF

SOCS055A – JUNE 1996 – REVISED APRIL 1997

### electrical characteristics over recommended operating ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		MIN	TYP†	MAX	UNIT
Dynamic range (see Note 2)	With CDS‡		69	70	dB
	Without CDS‡		58	59	
Charge-conversion factor			13		μV/e
Charge-transfer efficiency (see Note 3)		0.9999	0.99995	1	
Signal-response delay time, τ (see Note 4)			20		ns
Gamma (see Note 5)				1	
Output resistance		300	400	500	Ω
Noise-equivalent signal	With CDS‡	8.5	10	12	electrons
	Without CDS‡	30	36	42	
Rejection ratio	ADB (see Note 6)		20		dB
	SRG (see Note 7)		45		
	ABG (see Note 8)		25		
	RST (see Note 9)		47		
Supply current, I <sub>CC</sub>			5	10	mA
Input capacitance, C <sub>i</sub>	IAG1, IAG2		2000		pF
	SRG		70		
	RST		10		
	SAG		4000		

† All typical values are at T<sub>A</sub> = 25°C.

‡ CDS = Correlated double sampling, a signal-processing technique that improves noise performance by subtraction of reset noise.

§ The rejection ratio is measured at 12.5 MHz.

- NOTES:
- Dynamic range is –20 times the logarithm of the mean-noise signal divided by the saturation-output signal.
  - Charge-transfer efficiency is one minus the charge loss per transfer in the output register. The test is performed in the dark using an electrical-input signal.
  - Signal-response delay time is the time between the falling edge of the SRG pulse and the output-signal valid state.
  - Gamma (γ) is the value of the exponent in the equation below for two points on the linear portion of the transfer-function curve (this value represents points near saturation).

$$\left( \frac{\text{Exposure (2)}}{\text{Exposure (1)}} \right)^\gamma = \left( \frac{\text{Output signal (2)}}{\text{Output signal (1)}} \right)$$

- ADB rejection ratio is –20 times the logarithm of the ac amplitude at the output divided by the ac amplitude at ADB.
- SRG rejection ratio is –20 times the logarithm of the ac amplitude at the output divided by the ac amplitude at SRG.
- ABG rejection ratio is –20 times the logarithm of the ac amplitude at the output divided by the ac amplitude at ABG.
- RST rejection ratio is –20 times the logarithm of the ac amplitude at the output divided by the ac amplitude at RST.

Dark signal	$T_A = 45^\circ\text{C}$			1	mV
Dark-signal uniformity	$T_A = 45^\circ\text{C}$			0.5	mV
Dark-signal shading	$T_A = 45^\circ\text{C}$			0.5	mV
Spurious nonuniformity	Dark			10	mV
	Illuminated, F#8			15	%
Column uniformity				0.5	mV
Electronic-shutter capability		1/50,000	1/60		s

- NOTES: 10. Theoretical value  
 11. Saturation is the condition in which further increase in exposure does not lead to further increase in output signal.  
 12. Blooming is the condition in which charge is induced in an element by light incident on another element. Blooming-overload ratio is the ratio of blooming exposure to saturation exposure.  
 13. Smear is a measure of the error introduced by transferring charge through an illuminated pixel in shutterless operation. It is equivalent to the ratio of the single-pixel transfer time to the exposure time using an illuminated section that is 1/10 of the image-area vertical height with recommended clock frequencies.  
 14. The exposure time is 16.67 ms, the fast-dump clocking rate during vertical transfer is 12.5 MHz, and the illuminated section is 1/10 the height of the image section.

### MECHANICAL DATA

The package for the TC236P consists of a ceramic base, a glass window, a color filter, and a 12-lead frame. The glass window is sealed to the package by an epoxy adhesive. The package leads are configured in a dual-in-line organization and fit into mounting holes with 1,78-mm center-to-center spacings.
