APPLICATION INFORMATION

1. Chip Enable

This function turns ON or OFF all blocks by Low or High signal.

2. U, V and W Phase Output Amp

This part drives the output as making U, V and W current waveform having 120° phase difference with using the current ratio of each Amp output after giving the signal occurred by 2 Hall sensors to U Amp and V Amp.

It gets U, V and W phase output as operating output power TR sequentially by the relative current comparison.

3. Speed Control Part

This function compares the real motor rotation frequency with the 300 or 360Hz pulse divided from 1MHz clock pulse for removing a speed error when motor is ON and speed error is detected by PLL.

The speed error sent to charge pump part which repeats charge and discharge controls the output current of the output amp to keep a stable rotation.
