HD61203

(Dot Matrix Liquid Crystal Graphic Display Common Driver)

Description

The HD61203 is a common signal driver for dot matrix liquid crystal graphic display systems. It generates the timing signals (switch signal to convert LCD waveform to AC, frame synchronous signal) and supplies them to the column driver to control display. It provides 64 driver output lines and the impedance is low enough to drive a large screen.

As the HD61203 is produced by a CMOS process, it is fit for use in portable battery-driven equipment utilizing the liquid crystal display's low power consumption. The user can easily construct a dot matrix liquid crystal graphic display system by combining the HD61203 and the column (segment) driver HD61202.

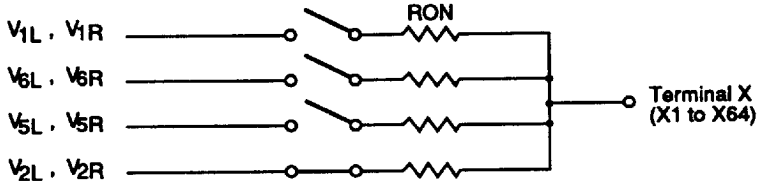
$$V_{1L} = V_{1R},\ V_{6L} = V_{6R} = V_{CC} - 1/7\ (V_{CC} - V_{EE})$$
$$V_{2L} = V_{2R},\ V_{5L} = V_{5R} = V_{EE} + 1/7\ (V_{CC} - V_{EE})$$



The following is a description of the range of power supply voltage for liquid crystal display drive. Apply positive voltage to V1L = V1R and V6L = V6R and negative voltage to V2L = V2R and V5L = V5R within the ΔV range. This range allows stable impedance on driver output (RON). Notice that ΔV depends on power supply voltage $V_{CC} - V_{EE}$.

Oscillator

The CR oscillator generates display timing signals and operating clocks for the HD61202. It is required when the HD61203 is used with the HD61202. An oscillation resister Rf and an oscillation capacitor Cf are attached as shown in figure 1 and terminal $\overline{STB}$ is connected to the high level. When using an external clock, input the clock into terminal CR and don't connect any lines to terminals R and C.

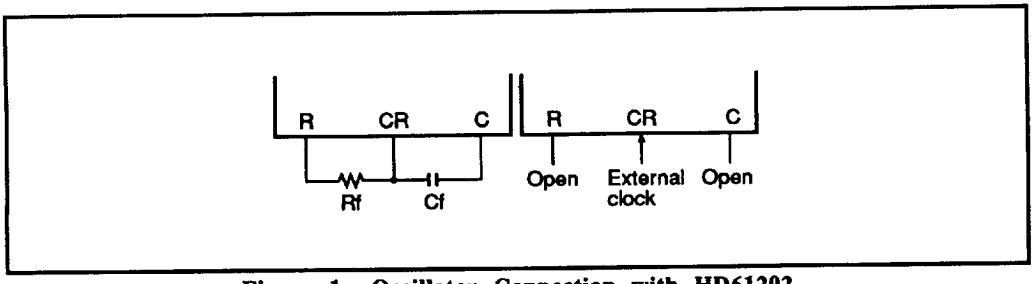

Figure 1 Oscillator Connection with HD61202

The oscillator is not required when the HD61203 is used with the HD61830. Then, connect terminal CR to the high level and don't connect any lines to terminals R and C (figure 2).

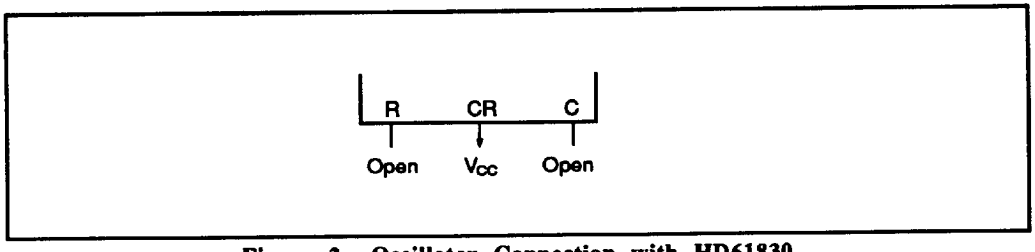

Figure 2 Oscillator Connection with HD61830

Timing Generator Circuit

The timing generator circuit generates display timing and operating clock for the HD61202. This circuit is required when the HD61203 is used with the HD61202. Connect terminal M/S to high level (master mode). It is not necessary when the display timing signal is supplied from other circuits, for example, from HD61830. In this case connect the terminals Fs, DS1, and DS2 to high level and M/S to low level (slave mode).

Bidirectional Shift Register

A 64-bit bidirectional shift register. The data is shifted from DL to DR when SHL is at high level and from DR to DL when SHL is at low level. In this case, CL2 is used as shift clock. The lowest order bit of the bidirectional shift register, which is on the DL side, corresponds to X1 and the highest order bit on the DR side corresponds to X64.

Liquid Crystal Display Driver Circuit

The combination of the data from the shift register with the M signal allows one of the four liquid crystal display driver levels V1, V2, V5 and V6 to be transferred to the output terminals (table 1).

Each of I/O common terminals DL, DR, CL2, and M is in the output state. M/S = GND: Slave mode The timing operation circuit stops operating. The HD61203 is used in this mode when combined with the HD61830. Even if combined with the HD61202, this mode is used when display timing signals (M, data, CL2, etc.) are supplied by another HD61203 in the master mode. Terminals M and CL2 are in the input state. When SHL is V_{CC}, DL is in the input state and DR is in the output state. When SHL is GND, DL is in the output state and DR is in the input state.

Select this condition when HD61203 is used with HD61202 or when MA of the HD61830 connects to CL2 in combination with the HD61830. FCS = GND: Shift register operates at the fall of CL2. Select this condition when CL1 of HD61830 connects to CL2 in combination with the HD61830.
FS	1	I	V_{CC} or GND	Selects frequency. When the frame frequency is 70 Hz, the oscillation frequency should be: f_{osc} = 430 kHz at FCS = V_{CC} f_{osc} = 215 kHz at FCS = GND This terminal is active only in the master mode. Connect it to V_{CC} in the slave mode.
