Features

- Next Generation Equivalent of ATF20V8B (ATF20V8BQ, ATF22V10BQC) •
- Complimentary Easy-to-use Atmel-WinCUPL Design Software
- "Z" Zero Power Compared to "L" Low Power
- Edge-sensing Zero Standby Power (10 µA Typical) (CQZ)
- Pin-controlled Zero Standby Power (10 µA Typical) Option (C, CQ)
- User-controlled Power-down Pin (C, CQ)
- High-speed Electrically Erasable Programmable Logic Devices • - 5 ns Maximum Pin-to-pin Delay (C)
- CMOS and TTL Compatible Inputs and Outputs •
 - Pin-keeper Feature Holds Inputs and I/Os to Previous Logic States WWW.DZSC
 - PCI Compliant
- High-reliability EE Process
 - 20 Year Data Retention
 - 100 Erase/Write Cycles
 - 2,000V ESD Protection
 - 200 mA Latch-up Immunity
- Commercial and Industrial Temperature Ranges

Block Diagram

Description

The ATF20V8C is a high-performance CMOS (electrically erasable) programmable logic device (PLD) that utilizes Atmel's proven electrically erasable technology. Speeds down to 5 ns and power dissipation as low as 10 μ A are offered. All speed ranges are specified over the full 5V \pm 10% range for industrial temperature ranges, and 5V \pm 5% for commercial ranges.

The ATF20V8C(Q) provides a high-speed CMOS PLD solution with maximum pin-to-pin delay of 5 ns. The ATF20V8C(Q) also has a user-controlled power-down feature, offering "zero" standby power (10 μ A typical). The user-controlled power-down feature allows the user to manage total system power to meet specific application requirements and enhance reliability without sacrificing speed.

The ATF20V8CQZ provides the zero power CMOS PLD solution, with "zero" standby power (10 μ A typical). The device powers down automatically through Atmel's patented Input Transition Detection (ITD) circuitry to the "zero" standby power mode when all inputs are idle.

Pin "keeper" circuits on input and output pins reduce static power consumed by pull-ups.

The ATF20V8C(Q)(Z) is the industry-standard 20V8 architecture. Eight outputs are each allocated eight product terms. Three different modes of operation, configured automatically with software, allow highly complex logic functions to be realized.

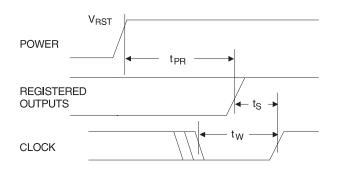

Power-up Reset

The registers in the ATF20V8Cs are designed to reset during power-up. At a point delayed slightly from V_{CC} crossing V_{RST} , all registers will be reset to the low state. As a result, the registered output state will always be high on power-up. This feature is critical for state machine initialization. How-

ever, due to the asynchronous nature of reset and the

uncertainty of how V_{CC} actually rises in the system, the following conditions are required:

- 1. The V_{CC} rise must be monotonic,
- 2. After reset occurs, all input and feedback setup times must be met before driving the clock pin high, and
- 3. The clock must remain stable during t_{PR} .

Preload of Registered Outputs

The ATF20V8C registers are provided with circuitry to allow loading of each register with either a high or a low. This feature will simplify testing since any state can be forced into the registers to control test sequencing. A JEDEC file with preload is generated when a source file with vectors is compiled. Once downloaded, the JEDEC file preload sequence will be done automatically by most of the approved programmers after the programming.

Electronic Signature Word

There are 64 bits of programmable memory that are always available to the user, even if the device is secured. These bits can be used for user-specific data.

ATF20V8C Family

Security Fuse Usage

A single fuse is provided to prevent unauthorized copying of the ATF20V8C's fuse patterns. Once programmed, fuse verify and preload are inhibited. However, the 64-bit User Signature remains accessible.

The security fuse should be programmed last, as its effect is immediate.

Programming/Erasing

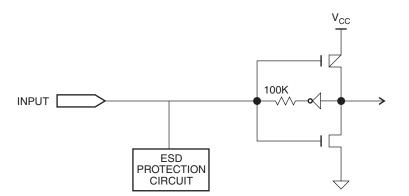

Programming/erasing is performed using standard PLD programmers. For further information, see the Configurable

Input Diagram

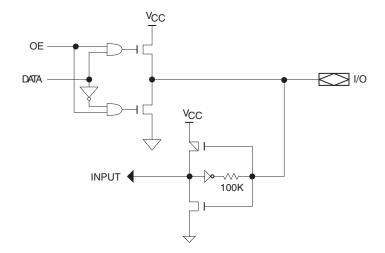

Logic data book section titled, "CMOS PLD Programming Hardware and Software Support."

Input and I/O Pull-ups

All ATF20V8C family members have internal input and I/O "pin-keeper" circuits. Therefore, whenever inputs or I/Os are not being driven externally, they will maintain their last driven state. This ensures that all logic array inputs and device outputs are at known states. These are relatively weak active circuits that can be easily overridden by TTL-compatible drivers (see input and I/O diagrams below).

I/O Diagram

Functional Logic Diagram Description

The logic option and functional diagrams describe the ATF20V8C architecture. Eight configurable macrocells can be configured as a registered output, combinatorial I/O, combinatorial output or dedicated input.

The ATF20V8C's macrocell can be configured in one of three different modes. Each mode makes the ATF20V8Cs look like a different device. The ATF20V8Cs can be a registered output, combinatorial I/O, combinatorial output or dedicated input. Most PLD compilers can choose the right mode automatically. The user can also force the selection by supplying the compiler with a mode selection. The determining factors would be the usage of register versus combinatorial outputs and dedicated outputs versus output with output enable control.

The ATF20V8Cs have a user-controlled power-down pin, which, when active, allows the user to place the device into a "zero" standby power-down mode. The device can also operate at high speed. Maximum pin-to-pin delays of 5 ns are offered. Static power loss due to pull-up resistors is eliminated by using input and output pin "keeper" circuits that hold pins to their previous logic levels when idle.

The universal architecture of the ATF20V8Cs can be programmed to emulate many 24-pin PAL devices. The user can download the subset device JEDEC programming file to the PLD programmer and the ATF20V8Cs can be configured to act like the chosen device.

Unused product terms are automatically disabled by the compiler to decrease power consumption. A security fuse, when programmed, protects the contents the ATF20V8Cs. Eight bytes (64 fuses) of User Signature are accessible to the user for purposes such as storing project name, part number, revision or date. The User Signature is accessible regardless of the state of the security fuse.

Compiler Mode Selection

Note: 1. Only applicable for version 3.4 or lower.

Registered Mode

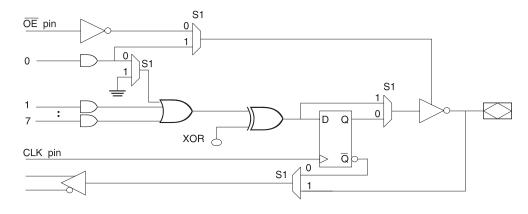

PAL Device Emulation/PAL Replacement

The registered mode is used if one or more registers are required. Each macrocell can be configured as either a registered or combinatorial output or I/O, or as an input. For a registered output or I/O, the output is enabled by the \overline{OE} pin, and the register is clocked by the CLK pin. Eight product terms are allocated to the sum term. For a combinatorial output or I/O, the output enable is controlled by a product term, and seven product terms are allocated to the

sum term. When the macrocell is configured as an input, the output enable is permanently disabled.

Any register usage will make the compiler select this mode. The following registered devices can be emulated using this mode:

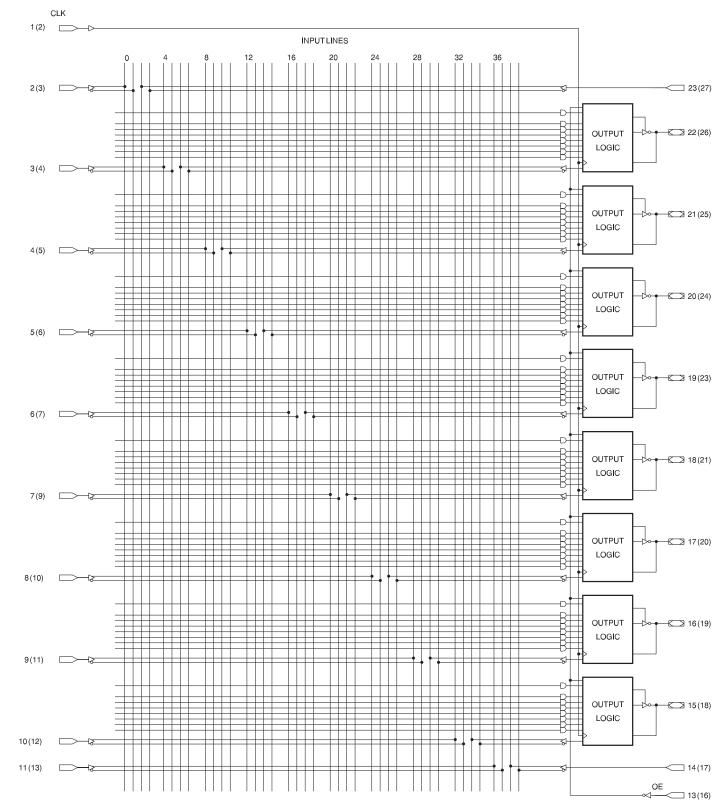

20R8	20RP8
20R6	20RP6
20R4	20RP4

Registered Mode Operation

AIMEL

Registered Mode Logic Diagram

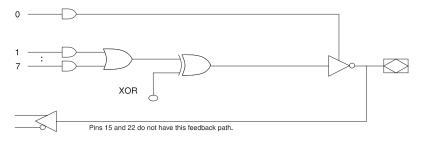

Complex Mode

PAL Device Emulation/PAL Replacement

In the Complex Mode, combinatorial output and I/O functions are possible. Pins 1 and 11 are regular inputs to the array. Pins 13 through 18 have pin feedback paths back to the AND-array, which makes full I/O capability possible. Pins 12 and 19 (outermost macrocells) are outputs only. They do not have input capability. In this mode, each macrocell has seven product terms going to the sum term and one product term enabling the output. Combinatorial applications with an OE requirement will make the compiler select this mode. The following devices can be emulated using this mode:

20L8 20H8 20P8

Complex Mode Operation

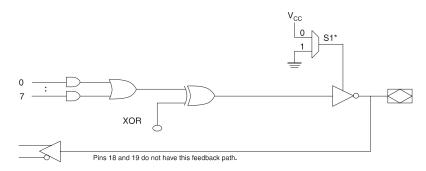

Simple Mode

PAL Device Emulation/PAL Replacement

In the Simple Mode, eight product terms are allocated to the sum term. Pins 15 and 16 (center macrocells) are permanently configured as combinatorial outputs. Other macrocells can be either inputs or combinatorial outputs with pin feedback to the AND-array. Pins 1 and 11 are regular inputs. The compiler selects this mode when all outputs are combinatorial without OE control. The following simple PALs can be emulated using this mode:

14L8	14H8	14P8
16L6	18H6	16P6
18L4	18H4	18P4
20L2	20H2	20P2

Simple Mode Option

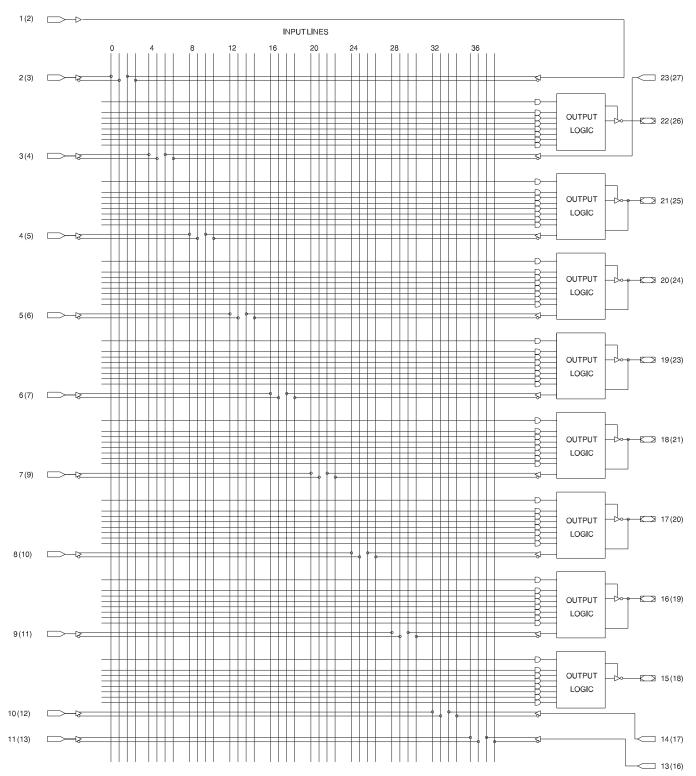

* - Pins 18 and 19 are always enabled.

Absolute Maximum Ratings*

Temperature under Bias
Storage Temperature65°C to +150°C
Voltage on Any Pin with Respect to Ground2.0V to +7.0V ⁽¹⁾
Voltage on Input Pins with Respect to Ground during Programming2.0V to +14.0V ⁽¹⁾
Programming Voltage with Respect to Ground2.0V to +14.0V ⁽¹⁾

- *NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- Note: 1. Minimum voltage is -0.6V DC, which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is V_{CC} + 0.75V DC, which may overshoot to 7.0V for pulses of less than 20 ns.
