## TEA5711; TEA5711T

#### **FEATURES**

- Wide supply voltage range: 1.8 or 2.1 to 12 V
- Low current consumption: 15 mA at AM, 16 mA at FM
- · High selectivity with distributed IF gain
- · LED driver for stereo indication
- High input sensitivity: 1.6 mV/m (AM), 2.0 μV (FM) for 26 dB S/N
- Good strong signal behaviour: 10 V/m at AM, 500 mV at FM
- Low output distortion: 0.8% at AM, 0.3% at FM
- · Signal level output
- Soft mute
- Signal dependent stereo

- Designed for simple and reliable printed-circuit board layout
- · High impedance MOSFET input on AM.

#### **APPLICATIONS**

- · Portable AM/FM stereo radio
- Mini/midi receiver sets
- · Personal headphone radio.

#### DESCRIPTION

The TEA5711 is a high performance Bimos IC for use in AM/FM stereo radios. All necessary functions are integrated: from AM and FM front-end to AM detector and FM stereo output stages.

### TEA5711; TEA5711T

#### **FUNCTIONAL DESCRIPTION**

The AM circuit incorporates a double balanced mixer, a one pin low-voltage oscillator (up to 30 MHz) a field-strength indicator output and is designed for distributed selectivity.

The AM input is designed to be connected to the top of a tuned circuit. AGC controls the IF amplification and for large signals it lowers the input impedance.

The first AM selectivity can be an IFT as well as an IFT combined with a ceramic filter; the second one is an IFT.

The FM circuit incorporates a tuned RF stage, a double balanced mixer, a one-pin oscillator, a field-strength indicator output and is designed for distributed IF ceramic filters. The FM quadrature detector uses a ceramic resonator.

The PLL stereo decoder incorporates a signal dependent stereo circuit, a soft-mute circuit and a stereo indicator LED driver.

#### Supply voltage behaviour

The TEA5711 incorporates internal stabilized power supplies. The maximum supply voltage is 12 V, the minimum voltage can go down temporarily to 1.8 V without any loss in performance.

Due to the capacitor at pin 19 (RIPPLE) the IC gives excellent performance, even when the actual supply voltage at pin 25 (V<sub>P</sub>) drops below the voltage at pin 19 (RIPPLE).

Figures 4, 5 and 6 show that  $V_{stab}$ , which is dominant for the overall IC performance, remains unaffected, even if  $V_P$  drops down to 1.8 V or less. In this typical example the static or average  $V_P$  is equal to 2.5 V. Dips in  $V_{stab}$  appear only when the peak-to-peak value of the AC-component of  $V_P > 2$  V, i.e. when the dynamic value of  $V_P$  drops down to 1.5 V for a short moment.

TEA5711; TEA5711T

#### **LIMITING VALUES**

In accordance with the Absolute Maximum Rating System (IEC 134).

| SYMBOL           | PARAMETER                     | MIN. | MAX. | UNIT |
|------------------|-------------------------------|------|------|------|

#### **Application remarks**

- Short circuiting: all pins are short-circuit proof except pin 16 (FM-RF<sub>I</sub>) with respect to the supply voltage pin.
- For an example of printed-circuit board layout: see Figs 9 and 10.
- · Align VCO with aerial signal present.

voltage ( $V_{in1}$ ;  $f_i = 1$  kHz). Measured in test circuit Fig.7 with  $V_P = 3.0$  V.

Fig.12 Typical AM audio voltage ( $V_{AF}$ ; signal at m = 0.3), noise and THD as a function of field-strength ( $f_1 = 1 \text{ kHz}$ ). Measured in application circuit Fig.8 with  $V_P = 3.0 \text{ V}$ .

Fig.13 Typical FM audio voltage ( $V_{AF}$ ; signal), noise, THD (at  $\Delta f = 22.5$  kHz and  $\Delta f = 75$  kHz) and indicator current (level) as a function of RF input voltage ( $V_{in1}$ ;  $\Delta f = 22.5$  kHz). Curves are shown without mute (mono) and with mute (mono and stereo). Channel separation at  $\Delta f = 75$  kHz. Measured in test circuit Fig.7 with  $V_P = 3.0$  V.
