

LT1126/LT1127

Dual/Quad

## Decompensated Low Noise, High Speed Precision Op Amps

### FEATURES

- 100% Tested Low Voltage Noise
- Slew Rate
- Gain-Bandwidth Product
- Offset Voltage, Prime Grade
- Low Grade
- High Voltage Gain
- Supply Current Per Amplifier
- Common Mode Rejection
- Power Supply Rejection
- Available in 8-Pin SO Package

|                           |     |
|---------------------------|-----|
| 2.7nV/ $\sqrt{\text{Hz}}$ | Typ |
| 4.2nV/ $\sqrt{\text{Hz}}$ | Max |
| 11V/ $\mu\text{s}$        | Typ |
| 65MHz                     | Typ |
| 70 $\mu\text{V}$          | Max |
| 100 $\mu\text{V}$         | Max |
| 5 Million                 | Min |
| 3.1mA                     | Max |
| 112dB                     | Min |
| 116dB                     | Min |

### APPLICATIONS

- Two and Three Op Amp Instrumentation Amplifiers
- Low Noise Signal Processing
- Active Filters
- Microvolt Accuracy Threshold Detection
- Strain Gauge Amplifiers
- Direct Coupled Audio Gain Stages
- Tape Head Preamplifiers
- Microphone Preamplifiers
- Accelerometer Amplifiers
- Infrared Detectors

### DESCRIPTION

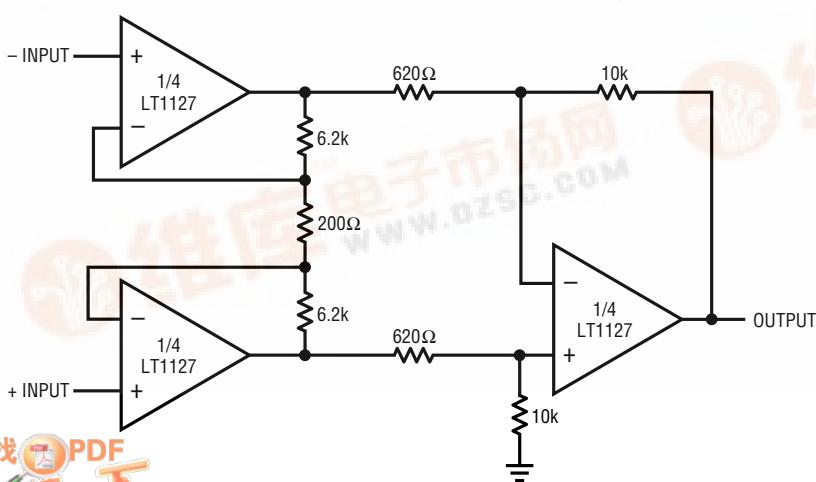

The LT1126 dual and LT1127 quad are high performance, decompensated op amps that offer higher slew rate and bandwidth than the LT1124 dual and the LT1125 quad operational amplifiers. The enhanced AC performance is available without degrading DC specs of the LT1124/LT1125. Both LT1126/LT1127 are stable in a gain of 10 or more.

In the design, processing, and testing of the device, particular attention has been paid to the optimization of the entire distribution of several key parameters. Slew rate, gain-bandwidth, and 1kHz noise are 100% tested for each individual amplifier. Consequently, the specifications of even the lowest cost grades (the LT1126C and the LT1127C) have been enhanced.

Power consumption of the dual LT1126 is less than one half of two OP-37s. Low power and high performance in an 8-pin SO package makes the LT1126 a first choice for surface mounted systems and where board space is restricted.

Protected by U.S. patents 4,775,884 and 4,837,496.

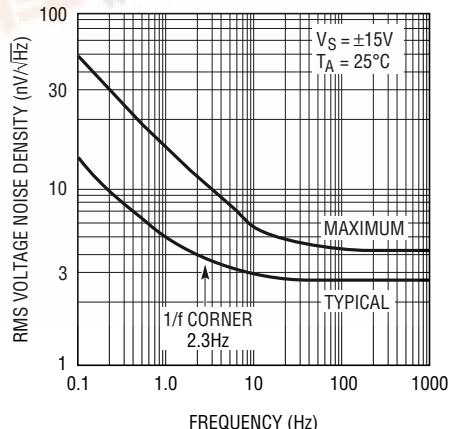

Low Noise, Wide Bandwidth Instrumentation Amplifier

GAIN = 100, BANDWIDTH = 480kHz

INPUT REFERRED NOISE = 4.5nV/ $\sqrt{\text{Hz}}$  AT 1kHz, 6 $\mu\text{V}_{\text{RMS}}$  OVER BANDWIDTH

Voltage Noise vs Frequency

LT1126 • TA02

# LT1126/LT1127

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage .....  $\pm 22\text{V}$   
 Input Voltage ..... Equal to Supply Voltage  
 Output Short Circuit Duration ..... Indefinite  
 Differential Input Current (Note 5) .....  $\pm 25\text{mA}$   
 Lead Temperature (Soldering, 10 sec.) .....  $300^\circ\text{C}$

Operating Temperature Range  
 LT1126AM/LT1126M .....  $-55^\circ\text{C}$  to  $125^\circ\text{C}$   
 LT1127AM/LT1127M .....  $-40^\circ\text{C}$  to  $85^\circ\text{C}$   
 LT1126AC/LT1126C .....  $-65^\circ\text{C}$  to  $150^\circ\text{C}$   
 LT1127AC/LT1127C .....  $-65^\circ\text{C}$  to  $150^\circ\text{C}$   
 Storage Temperature Range  
 All Grades .....  $-65^\circ\text{C}$  to  $150^\circ\text{C}$

The ● denotes the specifications which apply over the full operating temperature range.

**Note 1:** Typical parameters are defined as the 60% yield of parameter distributions of individual amplifiers; i.e., out of 100 LT1127s (or 100 LT1126s) typically 240 op amps (or 120) will be better than the indicated specification.

**Note 2:** This parameter is 100% tested for each individual amplifier.

**Note 3:** This parameter is sample tested only.

**Note 4:** This parameter is not 100% tested.

**Note 5:** The inputs are protected by back-to-back diodes. Current limiting resistors are not used in order to achieve low noise. If differential input voltage exceeds  $\pm 1.4V$ , the input current should be limited to 25mA.

**Note 6:** Slew rate is measured in  $A_V = -10$ ; input signal is  $\pm 1V$ , output measured at  $\pm 5V$ .

**Note 7:** 0.1Hz to 10Hz noise can be inferred from the 10Hz noise voltage density test. See the test circuit and frequency response curve for 0.1Hz to 10Hz tester in the Applications Information section of the LT1007 or LT1028 datasheets.

**Note 8:** This parameter is guaranteed but not tested.

**Note 9:** The LT1126 and LT1127 are not tested and are not quality assurance sampled at  $-40^\circ C$  and at  $85^\circ C$ . These specifications are guaranteed by design, correlation and/or inference from  $-55^\circ C$ ,  $0^\circ C$ ,  $25^\circ C$ ,  $70^\circ C$  and/or  $125^\circ C$  tests.

## TYPICAL PERFORMANCE CHARACTERISTICS

The typical behavior of many LT1126/LT1127 parameters is identical to the LT1124/LT1125. Please refer to the LT1124/LT1125 data sheet for the following performance characteristics:

- 0.1Hz to 10Hz Voltage Noise
- 0.01Hz to 1Hz Voltage Noise
- Current Noise vs Frequency
- Input Bias or Offset Current vs Temperature
- Output Short Circuit Current vs Time

- Input Bias Current Over the Common Mode Range
- Voltage Gain vs Temperature
- Input Offset Voltage Drift Distribution
- Offset Voltage Drift with Temperature of Representative Units
- Output Voltage Swing vs Load Current
- Common Mode Limit vs Temperature
- Channel Separation vs Frequency
- Warm-Up Drift
- Power Supply Rejection Ratio vs Frequency

## TYPICAL PERFORMANCE CHARACTERISTICS

\*See LT1115 data sheet for definition of CCIF testing

# LT1126/LT1127

## APPLICATIONS INFORMATION

### Matching Specifications

In many applications the performance of a system depends on the matching between two op amps, rather than the individual characteristics of the two devices. The three op amp instrumentation amplifier configuration shown in this data sheet is an example. Matching characteristics are not 100% tested on the LT1126/LT1127.

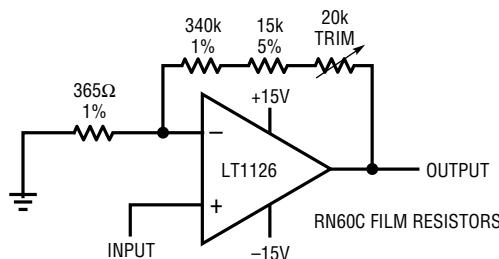

Some specifications are guaranteed by definition. For example, 70 $\mu$ V maximum offset voltage implies that mismatch cannot be more than 140 $\mu$ V. 112dB (= 2.5 $\mu$ V/V) CMRR means that worst case CMRR match is 106dB (5 $\mu$ V/V). However, the following table can be used to estimate the expected matching performance between the two sides of the LT1126, and between amplifiers A and D, and between amplifiers B and C of the LT1127.

### Expected Match

## TYPICAL APPLICATIONS

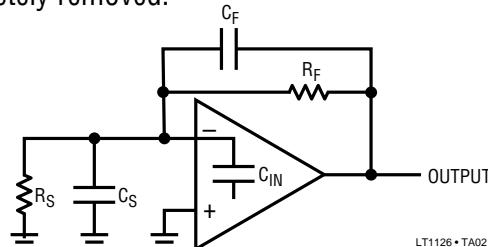

### Gain 1000 Amplifier with 0.01% Accuracy, DC to 5Hz

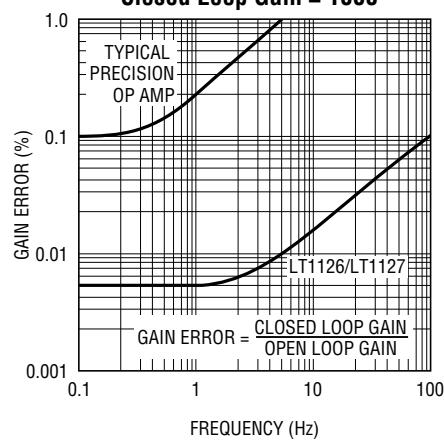

THE HIGH GAIN AND WIDE BANDWIDTH OF THE LT1126/LT1127 IS USEFUL IN LOW FREQUENCY HIGH CLOSED LOOP GAIN AMPLIFIER APPLICATIONS. A TYPICAL PRECISION OP AMP MAY HAVE AN OPEN LOOP GAIN OF ONE MILLION WITH 500kHz BANDWIDTH. AS THE GAIN ERROR PLOT SHOWS, THIS DEVICE IS CAPABLE OF 0.1% AMPLIFYING ACCURACY UP TO 0.3Hz ONLY. EVEN INSTRUMENTATION RANGE SIGNALS CAN VARY AT A FASTER RATE. THE LT1126/LT1127 "GAIN PRECISION — BANDWIDTH PRODUCT" IS 330 TIMES HIGHER, AS SHOWN.

### High Speed Operation

When the feedback around the op amp is resistive ( $R_F$ ), a pole will be created with  $R_F$ , the source resistance and capacitance ( $R_S$ ,  $C_S$ ), and the amplifier input capacitance ( $C_{IN} \approx 2pF$ ). In low closed loop gain configurations and with  $R_S$  and  $R_F$  in the kilohm range, this pole can create excess phase shift and even oscillation. A small capacitor ( $C_F$ ) in parallel with  $R_F$  eliminates this problem. With  $R_S (C_S + C_{IN}) = R_F C_F$ , the effect of the feedback pole is completely removed.

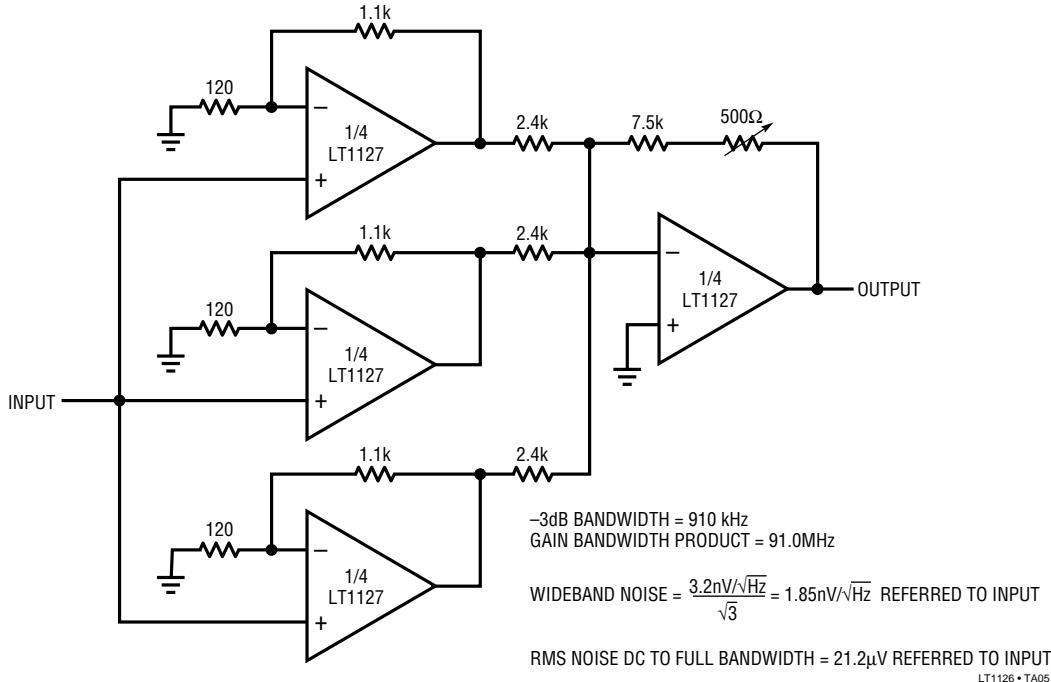

### Gain Error vs Frequency Closed Loop Gain = 1000

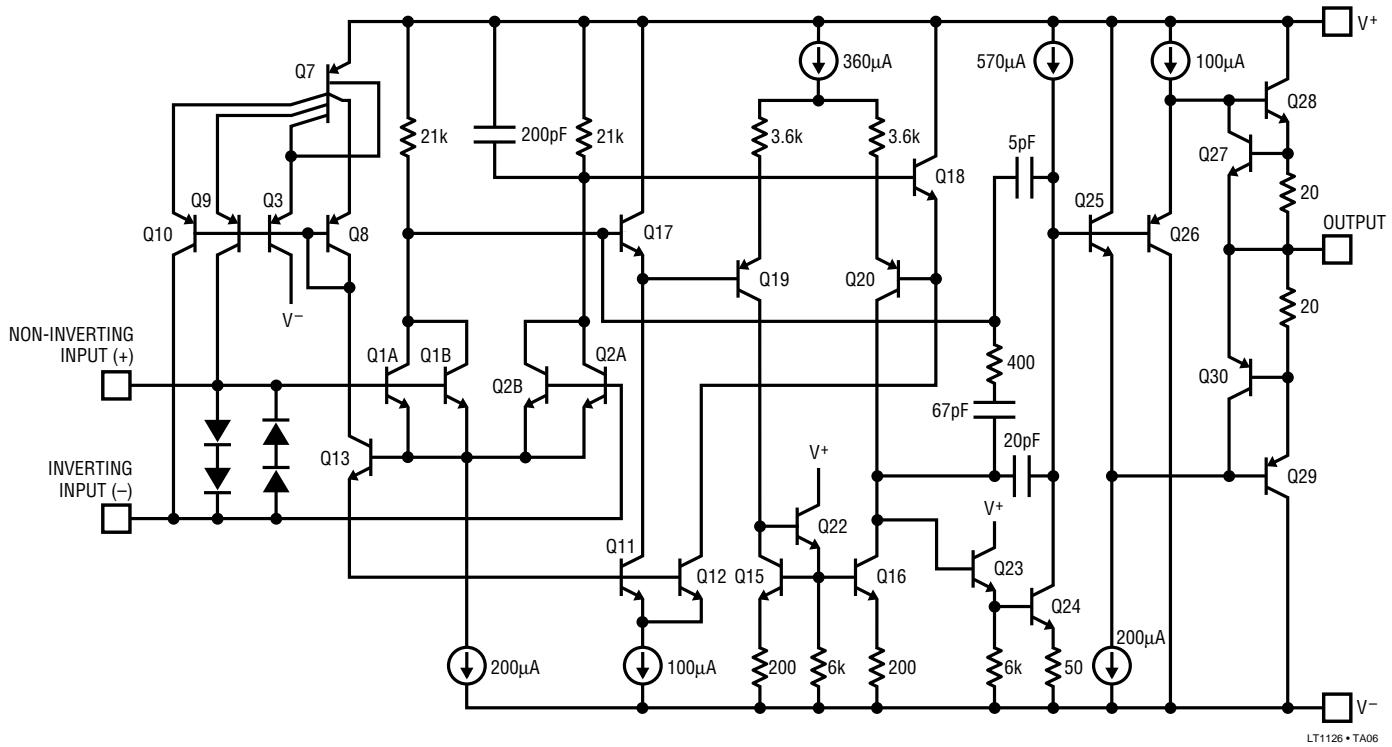

## TYPICAL APPLICATIONS

Low Noise, Wideband, Gain = 100 Amplifier with High Input Impedance

## SCHEMATIC DIAGRAM (1/2 LT1126, 1/4 LT1127)

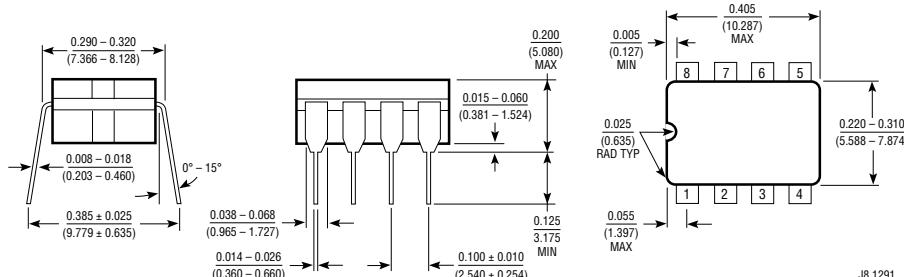

# LT1126/LT1127

## PACKAGE DESCRIPTION Dimensions in inches (millimeters) unless otherwise noted.

### J8 Package 8-Lead Ceramic DIP
