CMOS 4-BIT MICROCONTROLLER

**TMP47P202VP**  
**TMP47P202VM**

The 47P202V is the system evaluation LSI of 47C102/202 with 16K bits one-time PROM. The 47P202V programs / verifies using an adapter socket to connect with PROM programmer, as it is in TMM27256AD. In addition, the 47P202V and the 47C102/202 are pin compatible. The 47P202V operates as the same as the 47C102/202 by programming to the internal PROM.

**OPERATIONAL DESCRIPTION**

The following is an explanation of hardware configuration and operation in relation to the 47P202V. The 47P202V is the same as the 47C102/202 except that an OTP is used instead of a built-in mask ROM.

**1. OPERATION mode**

The 47P202V has an MCU mode and a PROM mode.

**1.1 MCU mode**

The MCU mode is set by attaching a resonator between the XIN and XOUT pins. Operation in the MCU mode is the same as for the 47C102/202. In the 47P202V, RC oscillation is impossible.

**1.1.1 Program Memory**

The program storage area is the same as for the 47C202. Don't use the addresses 400 to 7FF<sub>H</sub> when using the 47P102V to check 47C102 operation.

Figure 1-1. Program Area

Figure 1-2. RAM Address Assignment

**1.1.2 Data Memory**

The 47P202V has 128 × 4-bit of data memory (RAM). When the 47P202V is used as the 47C102 evaluator, programming should be performed assuming that the RAM is assigned to address 00 to 0F<sub>H</sub> and 50 to 7F<sub>H</sub> as show in Figure 1-2. When the BM47C203 (emulator) is used as the 47C102 evaluator, it is same. Further, zero-page (addresses 00 to 0F<sub>H</sub>) and special function shared area (stack location 0 to 3) are overlapped on the 47C102.

### 1.1.3 Input / Output Circuitry

(1) Control pins

This is the same as I/O code FA of the 47C102/202. In the 47P202V, RC oscillator is impossible. Connecting the resonator or inputting the external clock to XIN pin are required when using as evaluator of I/O code FD, FE.

(2) I/O Ports

The input / output circuit of the 47P202V is the same as I/O code FA or FD of the 47C102/202. External resistance, for example, is required when using as evaluator of other I/O codes (FB, FE).

Figure 1-3. I/O code and external circuitry (Codes FB, FE)

## 1.2 PROM mode

The 47P202V enters PROM mode by sending external clock signal from XIN pin when XOUT pin is at low level. In PROM mode, programs can be written or verified using a general-purpose PROM writer with an adapter socket (BM1187) being attached.

With the 47P202V, the PROM address input and data input/output use the same port. PROM mode control signal (XOUT) is used for switching between two functions. XOUT pin becomes control signal input after PROM mode is completed.

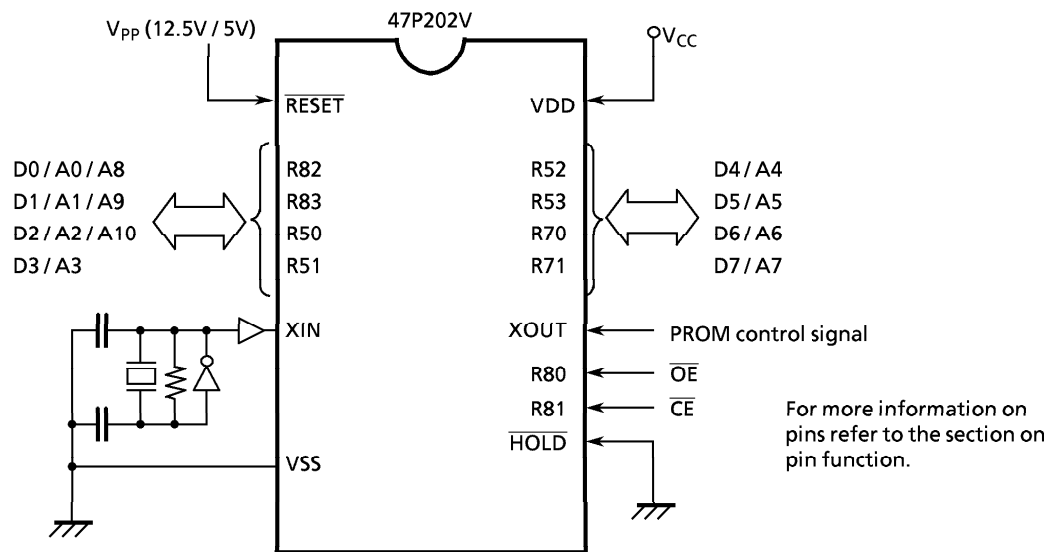

Figure 1-4. Setting for PROM mode

### 1.2.1 Program Writing

When writing a program, set a ROM type to "27256A" (programming voltage : 12.5 V) . Since the 47P202V has a 2048 × 8-bit internal PROM (000 to 7FF<sub>H</sub>) , set a stop address of a PROM writer to "7FF<sub>H</sub>" . For a general-purpose PROM writer, use the writer which does not have or can release an electric signature mode.

**Note.** When the data written to OTP is same as the data of PROM programmer, there is the possibility that the security writing can not be executed, which is depended on the types of PROM programmers.

In this case, set the data of PROM programmer to "00" and execute the security writing after writing the data to OTP.

### 1.2.2 High Speed Programming Mode

The program time can be greatly decreased by using this high speed programming mode. The device is set up in the high speed programming mode when the programming voltage (+ 12.5 V) is applied to the  $V_{pp}$  terminal with  $V_{CC} = 6 V$  and  $\overline{CE} = V_{IH}$ .

The programming is achieved by applying a single low level 1ms pulse the  $\overline{CE}$  input after addresses and data are stable. Then the programmed data is verified by using Program Verify Mode.

If the programmed data is not correct, another program pulse of 1ms is applied and then programmed data is verified. This should be repeated until the program operates correctly (max. 25 times).

After correctly programming the selected address, one additional program pulse with pulse width 3 times that needed for programming is applied.

When programming has been completed, the data in all addresses should be verified with  $V_{CC} = V_{pp} = 5 V$ .

(Note) DO ; Data output (I0 to I7), AL ; Address input (A0 to A7)  
 DI ; Data input (I0 to I7), AH ; Address input (A8 to A10)

*Note. There are some PROM programmer types which cannot program OTP.  
In TMP47P202V, VPP pin is also used as RESET pin. To set a mode, REST/VPP pin must be set to "low" during 1 ms and more after the rising of power-on and the rising of VDD electrical power.*
