100395

Low Power 9-Bit ECL-to-TTL Translator with Registers

General Description

The 100395 is a 9-bit translator for converting F100K logic levels to TTL logic levels. A HIGH on the output enable (OE) holds the TTL outputs in a high impedance state. Two separate clock inputs are available for multiplexing and system level testing.

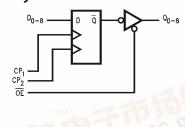

The 100395 is designed with TTL 64 mA outputs for bus driving capability. All inputs have 50 k Ω pull down resistors. When the inputs are either unconnected or at the same potential, the outputs will go LOW.

- **Features**
- 64 mA I_{OL} drive capability
- 2000V ESD protection
- -4.2V to -5.7V operating range
- Registered outputs
- TTL outputs

Recommended Operating Conditions

| Case Temperature (T _C) | $0^{\circ}C$ to $+85^{\circ}C$ |
|------------------------------------|--------------------------------|
| Supply Voltage | |
| V _{EE} | -5.7V to -4.2V |
| V _{TTL} | +4.5V to +5.5V |

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: ESD testing conforms to MIL-STD-883, Method 3015.

Note 3: The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
