## 74ALVC162245

### Low Voltage 16-Bit Bidirectional Transceiver with 3.6V Tolerant Inputs and Outputs and 26Ω Series Resistors in A Port Outputs

#### General Description

The ALVC162245 contains sixteen non-inverting bidirectional buffers with 3-STATE outputs and is intended for bus oriented applications. The device is byte controlled. Each byte has separate 3-STATE control inputs which can be shorted together for full 16-bit operation. The T/R inputs determine the direction of data flow through the device. The OE inputs disable both the A and B Ports by placing them in a high impedance state.

The 74ALVC162245 is designed for low voltage (1.65V to 3.6V) V<sub>CC</sub> applications with I/O compatibility up to 3.6V.

The 74ALVC162245 is also designed with 26Ω series resistance in the A Port outputs. This design reduces line noise in applications such as memory address drivers, clock drivers, and bus transceivers/transmitters.

The 74ALVC162245 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### Features

- 1.65V–3.6V V<sub>CC</sub> supply operation
- 3.6V tolerant inputs and outputs
- 26Ω series resistors in A Port outputs
- I<sub>PD</sub>
  - 3.9 ns max for 3.0V to 3.6V V<sub>CC</sub>
  - 4.8 ns max for 2.3V to 2.7V V<sub>CC</sub>
  - 8.6 ns max for 1.65V to 1.95V V<sub>CC</sub>
- Power-down high impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- Uses patented noise/EMI reduction circuitry
- Latchup conforms to JEDEC JED78
- ESD performance:
  - Human body model > 2000V
  - Machine model >200V

**Note 1:** To ensure the high-impedance state during power up or power down, OE should be tied to V<sub>CC</sub> through a pull-up resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.
