

MAXIM

MAX3762 Evaluation Kit

General Description

The MAX3762 evaluation kit (EV kit) simplifies evaluation of the MAX3762 limiting amplifier. It allows easy programming of the loss-of-signal (LOS) threshold. The board layout provides for multiple termination configurations. The circuit includes space for the MAX3760 preamplifier and user-supplied photodiode. Adding these two components to the MAX3762 forms a complete fiber optic receiver.

Features

- ◆ Fully Assembled and Tested
- ◆ Easy LOS Threshold Programming
- ◆ Multiple Output Terminations
- ◆ Circuit Includes MAX3760 Preamplifier*
- ◆ Socket for User-Supplied Photodiode Signal Source

Evaluates: MAX3762

MAX3762 Evaluation Kit

Quick Start

- 1) Connect a +5V power supply to the +5V pad, then connect the power-supply ground to the GND pad.
- 2) Ensure that the JU3 shunt is across pins 1 and 2.
- 3) Ensure that JU5 and JU4 are open.
- 4) Ensure that JU7 is shorted.
- 5) Apply a 100mV signal at VIN+ and VIN-, with a 622Mbps data rate.
- 6) Connect OUT+ and OUT- to a 50Ω terminated oscilloscope.

Detailed Description

Data Inputs

Differential Drive from a Signal Generator

The MAX3762 EV kit is factory configured with a 100Ω differential load AC coupled to the MAX3762 inputs.

Single-Ended Drive from a Signal Generator

Remove R12, install R10 and R11 = 49.9Ω, and connect the signal generator to VIN+. This provides a 50Ω termination to ground for the signal generator.

Differential Input from the Preamplifier

The MAX3762 EV kit incorporates the MAX3760 transimpedance amplifier. If the MAX3760 preamplifier is used, connect the +5V supply to the terminal labeled 5V OFFSET. Install shorts in L5 and L6 to connect the preamplifier to the limiting amplifier. Verify that R12 = 100Ω. Connect a signal generator to the preamplifier, or use a photodiode and light source connected at D3.

If a photodiode is used, remove R41. Figure 1 shows the proper installation of a user-supplied photodiode.

Figure 1. Photodiode Connection

Data-Output Terminations

Oscilloscope Connection

The MAX3762 EV kit is shipped configured to connect to a 50Ω terminated oscilloscope. Each output is AC coupled and has a 330Ω resistor to ground which provides bias current.

PECL Outputs

To drive a circuit that requires a PECL input, remove the 330Ω resistors (R25 and R29) and short the coupling capacitors (R24 and R28), then terminate with 50Ω to VCC - 2V.

LOS Outputs

The MAX3762's LOS outputs are PECL compatible, and are factory configured with 470Ω bias resistors. These outputs can be measured directly with a high-impedance oscilloscope or a voltmeter.

To measure LOS outputs with a 50Ω oscilloscope, remove R17 and R21, and install 274Ω resistors in R16 and R20.

To drive a PECL input, install 0Ω resistors in R15, R16, R19, and R20, and open R17 and R21. Then terminate with 50Ω to VCC - 2V.

Adjustments and Controls

LOS Voltage Threshold Adjustment

Potentiometer R4 adjusts the VTH voltage, which programs the LOS threshold. Refer to the MAX3762 data sheet for details.

Preamplifier Offset Current

Potentiometer R43 adjusts the amount of offset current at the preamplifier input (for use with the MAX3760 transimpedance amplifier). Refer to the MAX3760 data sheet for details.

Jumper JU7

JU7 implements the squelch function. When JU7 is shorted, the LOS+ terminal is connected to the DISABLE pin. When LOS+ is asserted high, the data outputs are disabled. If shorting JU7, remove JU5.

Jumper JU3

For normal operation, short pins 1 and 2.

Jumper JU5

JU5 sets the voltage at the disable pin. To hold the MAX3762's outputs enabled, short pins 2 and 3. To hold the MAX3762's outputs disabled, short pins 1 and 2. Remove JU5 if JU7 is used.

Figure 2. MAX3762 EV Kit Schematic

MAX3762 Evaluation Kit

Figure 2. MAX3762 EV Kit Schematic (continued)

Jumper JU6

JU6 connects a current mirror to the MAX3760 transimpedance amplifier input, allowing DC offset current to be added to the input signal. This is a convenient place to measure the added DC offset current.

Jumper JU4

When shorted, JU4 disables the MAX3762's offset correction. This allows DC parameter testing.

Layout Considerations

Note that the EV kit board contains four layers. The layers beneath the MAX3760 inputs were relieved to reduce capacitance at the transimpedance amplifier's input. Controlled impedance lines were used for output signal paths.
