## MAX1895 Evaluation Systems

## General Description

The MAX1895 evaluation systems are assembled and tested PC boards that demonstrate the MAX1895 high－ efficiency，wide brightness range CCFL backlight con－ troller．The MAX1895EVSYS－S is designed for single－ lamp applications and the MAX1895EVSYS－D is designed for dual－lamp applications．Both systems can control the brightness of the lamps through either the SMBus interface or by an on－board potentiometer．
The systems include a Maxim SMBus ${ }^{\text {TM }}$ interface board （MAXSMBUS），which allows an IBM－compatible PC to use its parallel port to emulate an Intel system manage－ ment bus（SMBus） $\mathrm{I}^{2} \mathrm{C}^{\text {TM }}$ interface．Windows $95 / 98^{®_{-}}$ compatible software provides a user－friendly interface to exercise the features of the MAX1895．The program is menu－driven and offers a graphic interface with con－ trol buttons and status display．
Note：Windows NT／2000 requires additional driver soft－ ware；contact the factory．
To evaluate the performance of the MAX1995，config－ ure the MAX1895EVSYS for analog interface mode． There is no need to change the IC since the MAX1895＇s performance is identical to the MAX1995＇s performance． See Detailed Description of Hardware，Table 2 and Table 3.

Component Suppliers

| SUPPLIER | PHONE | FAX |

Features
－Single Lamp Application（MAX1895EVSYS－S） Dual Lamp Application（MAX1895EVSYS－D）
－7V to 24V Input Range
－Wide Brightness Adjustment Range
－Open Lamp Protection with 2s Timeout
－Brightness Adjustable through SMBus Interface or On－Board Potentiometer
－No Flicker at Low Brightness
－High Power－to－Light Efficiency
－$I^{2} \mathrm{C} /$ SMBus Compatible
－Easy to Use Menu－Driven Software
－Assembled and Tested
－Includes：Windows 95／98－Compatible Software （3．5in Floppy Disk）and Demo PC Board

# MAX1895 Evaluation Systems 

## Quick Start

## Required Equipment

Before you begin you will need the following equipment:

- An IBM PC-compatible computer running Windows 95/98
- A parallel printer port (this is a 25-pin socket on the back of the computer)
- A standard 25-pin, straight-through, male-to-female cable to connect the computer's parallel port to the Maxim SMBus interface board
- A DC power supply capable of supplying any voltage between 7 V to 20 V at 100 mA to power the SMBus board
- A DC power supply capable of supplying a voltage between 7 V to 24 V at 2 A to power the MAX1895 board
- A CCFL lamp with the following specifications:

$$
\begin{aligned}
& \text { Maximum Strike Voltage } \leq 1.2 \mathrm{kV} \\
& \text { Lamp Current } \leq 6 \mathrm{~mA} \\
& \text { Input Power } \leq 4 \mathrm{~W}
\end{aligned}
$$

Note: Analog interface operation requires only a power supply (between 7 V to 24 V at 2 A ) and a CCFL lamp.

WARNING! High voltages are present on this evaluation kit. Use caution when making connections and applying power.

Procedure

1) Carefully connect the boards by aligning the 20-pin connector of the MAX1895 EV kit with the 20-pin header of the MAXSMBUS interface board. Gently press them together. The two boards should be flush against each other.
2) Do not turn on the power until all connections are made.
3) Connect the lamp to the high-voltage pads.
4) Set the jumpers to the following position:

| JU1 | Open |
| :--- | :--- |
| JU2 | $1-3$ |
| JU3 | $1-4$ |
| JU4 | $1-2$ |
| JU5 | Open |
| JU6 | $1-2$ |
| JU7 | $1-2$ |

5) Connect a cable from the computer's parallel port to the SMBus interface board. Use a straightthrough 25-pin female-to-male cable. To avoid damaging the EV kit or your computer, do not use a 25 pin SCSI port or any other connector that is physically similar to the 25-pin parallel printer port.
6) The MAX1895.EXE software program can be run from the floppy or hard drive. Simply use the Windows program manager to run the program. If desired, you may use the INSTALL.EXE program to copy the files and create icons for them in the Windows 95/98 Start Menu. An uninstall program is included with the software. Simply click on the UNINSTALL icon to remove the EV kit software from the hard drive.
7) Connect a 7 V to 20 V DC power supply to the pads labeled POS9 and GND1 of the SMBus interface board.
8) Connect the 12 V supply to the pads labeled VIN and GND.
9) Turn on both power supplies.
10) Start the MAX1895 program by opening its icon in the Start Menu.
11) Observe as the program automatically detects the address of the MAX1895 and starts the main program.

## Detailed Description of Software

## User-Interface Panel

The user interface is easy to operate using the mouse, or by using the tab key to navigate with the arrow keys. Each of the buttons corresponds to bits in the command and configuration bytes. Clicking on them generates the correct SMBus write operation to update the internal registers.
The brightness of the lamp can be adjusted by either moving the trackbar or by entering a value between 0 and 31 into the edit field located below the trackbar. Pressing enter after typing in the new value updates the internal register.
The SHMD register configures the operation of the device as described in Table 1.
When the Automatic Read feature is enabled, the program polls the MAX1895 twice a second. The brightness, mode, and status are read and the appropriate fields are updated on the main display. Unchecking the checkbox can disable this feature and each field can be updated individually by clicking the appropriate button.

## MAX1895 Evaluation Systems

The Brightness Cycle feature cycles the brightness through its entire range.
The Status register indicates whether the lamp circuit has opened (Status1 low) or an overcurrent condition has occurred (Status0 low).
The RESET button will set the MAX1895 and software to the POR state. If in doubt, click the reset button.

Simple SMBus Commands
There are two methods for communicating with the MAX1895: through the normal user-interface panel, or through the SMBus commands available from pressing the MAXSMBUS button. A display pops up that allows the SMBus protocols, such as Read Byte and Write Byte, to be executed. To stop normal user-interface execution so that it does not override the manually set values, turn off the timer by unchecking the Automatic Read checkbox.
The SMBus dialog boxes accept numeric data in binary, decimal, or hexadecimal. Hexadecimal numbers should be prefixed by $\$$ or $0 x$. Binary numbers must be exactly 8 digits.

Detailed Description of Hardware

Jumper JU1
Jumper JU1 connects the current limit pin (ILIM) to VCC.
With the shunt installed, the current limit is set to:

$$
\frac{0.2 \mathrm{~V}}{\mathrm{R}_{\mathrm{DS}(\mathrm{ON})} \text { of } \mathrm{N} 1}
$$

With the shunt removed, the current limit is determined by the RDS(ON) of MOSFET N1 and the resistor-divider
formed by R1 and R2. Use the equation shown below to calculate the current limit:

$$
\text { Current Limit }(A)=\frac{1}{5} \times \frac{2 \mathrm{~V} \times \frac{\mathrm{R} 2}{\mathrm{R} 1+\mathrm{R} 2}}{\mathrm{R}_{\mathrm{DS}(\mathrm{ON})} \text { of } \mathrm{N} 1}
$$

The MAX1895 EV kit (single lamp) is shipped with R1 = $100 \mathrm{k} \Omega$, R2 open, and RDS(ON)-TYPICAL $=0.113 \Omega$. The dual lamp has an RDS(ON)-TYPICAL $=0.044 \Omega$.

## Jumper JU2

Jumper JU2 sets the voltage on the MINDAC pin. This voltage sets the DAC's minimum scale output voltage, which sets the lamp brightness for the minimum DAC code.
In the 1-2 position, MINDAC is connected to VCC. In this position, the lamp is completely off at the minimum scale. Additionally, the DPWM dimming function is disabled (refer to the MAX1895 data sheet).
In the 1-3 position, MINDAC is connected to REF through a voltage-divider formed by R3 and R4. The voltage on MINDAC is approximately 0.67 , allowing a minimum analog dimming range of $33 \%$ of maximum brightness. The DPWM dimming function still remains available.
In the 1-4 position, MINDAC is connected directly to REF. The voltage on MINDAC is 2 V effectively disabling analog dimming. Only DPWM dimming is available.

## Jumper JU3

Jumper JU3 sets the MAX1895 to either analog interface or SMBus interface. There are two possible settings in analog interface: negative scale and positive scale. In negative-scale analog interface (JU3 $=1-2$ ), the brightness of the lamp decreases as the voltage on

Table 1. $\overline{\mathrm{SH}} /$ SUS and SHMD Register Truth Table

| $\overline{\mathbf{S H} / \text { SUS }}$ | SHMD2 | SHMD1 | SHMD0 | OPERATING MODE |
| :---: | :---: | :---: | :---: | :--- |
| 0 | 0 | X | 0 | Operate |
| 0 | 0 | X | 1 | Shutdown STATUS1 set |
| 1 | 0 | 0 | X | Operate |
| 1 | 0 | 1 | X | Shutdown STATUS1 set |
| $X$ | 1 | X | X | Shutdown STATUS1 set |

# MAX1895 Evaluation Systems 

pin CTL/SCL increases. In positive-scale ADC interface ( $\mathrm{JU} 3=1-3$ ), the brightness of the lamp increases as the voltage on pin CTL/SCL increases. Jumper (JU3 = 1-4) enables the SMBus interface on the MAX1895. Refer to the MAX1895 data sheet for more information.

## Jumper JU4

Jumper JU4 connects the CRF/SDA pin to VCC either directly (position 2-3) or through a $10 \mathrm{k} \Omega$ resistor (position 1-2).
Position 1-2 is for SMBus operation. A $10 \mathrm{k} \Omega$ pullup resistor is connected to the SMBus data signal.
To use the analog interface, connect JU4 to position 2-3. The CRF/SDA pin sets the full brightness reference for the CTL/SCL pin. Connecting this pin directly to VCC sets the full brightness reference voltage to 5.3 V . To use a voltage other than 5.3 V , leave JU4 open and apply an external voltage to the pad CRF/SDA.

Jumpers JU5 and JU6
The jumper JU5 must be left open for SMBus operation to prevent loading to the SMBus data signal.

Jumper JU6, position 1-2, is for SMBus operation. A $10 \mathrm{k} \Omega$ pullup resistor is connected to the SMBus clock signal. To use analog interface, install a shunt on JU5. This connects potentiometer R8 to the CRF/SDA pin voltage.
When using this mode, jumper JU6 must be installed in the 2-3 position. This connects the wiper of R8 to the CTL/SCL pin. Adjusting R8 changes the voltage on this pin, which changes the brightness of the lamp.

Jumper JU7
Jumper JU7, position 1-2, enables the MAX1895 unless the SMBus suspend line ( $\overline{\mathrm{SH}} / \mathrm{SUS}$ ) pulls low.
In the 2-3 position, the MAX1895 is placed into shutdown mode.

Jumper JU8 Jumper JU8 connects the power-supply input for the gate drivers (VDD), to the 5.3 V linear regulator output (VCC).
To use a different voltage for the gate drivers, cut the trace shorting jumper JU8 and apply the desired voltage to the pad labeled VDD.

Table 2. Jumper Settings Description

| JUMPER | SHUNT LOCATION | FUNCTION |
| :---: | :---: | :---: |
| JU1 | Open* | Current limit is set by the resistor-divider formed by R1 and R2. (The MAX1895 EV kit is shipped with R1 $=100 \mathrm{k} \Omega$ and $R 2$ open.) |
|  | Closed | $\text { Current limit is set to: } \frac{0.2 \mathrm{~V}}{\mathrm{R}_{\mathrm{DS}(\mathrm{ON})} \text { of } \mathrm{N} 1}$ <br> Note: Remove R1 before installing the shunt. |
| JU2 | 1-2 | MINDAC = VCC: disables the DPWM chopping function. |
|  | $1-3^{*}$ | MINDAC $\cong 0.67 \mathrm{~V}$ : MINDAC is connected to REF through a voltage-divider formed by R3 and R4. This voltage sets the DAC's minimum scale output voltage. |
|  | 1-4 | MINDAC = 2V: MINDAC is connected to REF. Analog dimming is disabled. |
| JU3 | 1-2 | MODE = REF: (negative-scale analog interface), CTL/SCL = OV results in maximum brightness. |
|  | 1-3 | MODE = GND: (positive-scale analog interface), CTL/SCL $=0 \mathrm{~V}$ results in minimum brightness. |
|  | 1-4* | MODE = VCC: enable SMBus interface. |
| JU4 | Open | Used for analog interface: drive CRF/SDA with an external voltage. The external voltage is the reference voltage. (JU3 must be in 1-2 or 1-3 position. JU5 = closed.) |
|  | 1-2* | Used for SMBus interface: CRF/SDA connected to VCC through 10k p pullup resistor. |
|  | 2-3 | Used for analog interface: CRF/SDA = VCC. VCC is the full-brightness reference input voltage. (JU3 must be in 1-2 or 1-3 position. JU5 = closed.) |

[^0]
## MAX1895 Evaluation Systems

Table 2. Jumper Settings Description (continued)

| JUMPER | SHUNT <br> LOCATION | FUNCTION |
| :---: | :---: | :--- |
|  | Open* | Used for SMBus interface: drive CRF/SDA with SMBus data. |
|  | Closed | Used for analog interface: drive CRF/SDA with analog voltage. (Connect JU2 to 1-2 position to use <br> VCC as the analog voltage.) |
| JU6 | $1-2^{\star}$ | Used for SMBus interface: CTL/SCL connected to VCC through 10k $\Omega$ pullup resistor. |
|  | $2-3$ | Used for analog interface: CTL/SCL connected to ADC reference input voltage (CRF/SDA) <br> through potentiometer R8. Adjusting R8 changes the brightness. |
|  | $1-2^{*}$ | Used for SMBus mode: SH/SUS is connected to VCC through 10k $\Omega$ pullup resistor. |
|  | $2-3$ | Places the MAX1895 into shutdown. |
| JU8 | Open | Drive VDD (power supply for the gate drivers) with an external power supply. |
|  | Closed* | VDD is tied to VCC (pin 28, 5.3V linear regulator output). |
