

## CMOS 8-Bit Microcontroller

### TMP86FP24F

The TMP86FP24 is a Flash type MCU which includes 48 K bytes Flash memory. It is a pin compatible with a mask ROM product of the TMP86CP24. Writing the program to built-in Flash memory, the TMP86FP24 operates as the same way as the TMP86CP24. The TMP86FP24 has a 2 K bytes BOOT ROM (masked ROM) for programming to Flash memory.

- For a discussion of how the reliability of microcontrollers can be predicted, please refer to Section 1.3 of the chapter entitled Quality and Reliability Assurance / Handling Precautions.
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.  
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.

Note: The mask ROM product (TMP86CP24) doesn't have a BOOT function in P23 pin.

## Block Diagram

## Pin Functions

The TMP86FP24 has MCU mode and serial PROM mode.

### (1) MCU mode

In the MCU mode, the TMP86FP24 is a pin compatible with the TMP86CP24 (Make sure to fix the TEST pin to low level).

### (2) Serial PROM mode

In the Serial PROM mode, programming to Flash memory is available by executing BOOT ROM. For details, refer to “2.1 Serial PROM mode”.

## 1.1 FLASH Memory

### 1.1.1 Outline

The TMP86FP24 incorporates 49152 bytes of FLASH memory (address 4000H to FFFFH). The writing to FLASH is controlled by FLASH control register (EEPCR), FLASH status register (EEPSR) and FLASH write emulate time control register (EEPEVA).

To write data to the FLASH, execute the Serial PROM mode. For details about the Serial PROM mode, refer to “2.1 Serial PROM mode”.

The FLASH memory of the TMP86FP24 features:

- The FLASH memory is constructed of 384 pages FLASH and one page size is 128 bytes (384 pages × 128 bytes = 49152 bytes).
- The TMP86FP24 incorporates a 128-byte temporary data buffer. The data written to FLASH is temporarily stored in this data buffer. After 128 bytes data have been written to the temporary data buffer, the writing to FLASH automatically starts by page writing (The 128 bytes data are written to specified page of FLASH simultaneously). At the same time, page-by-page erasing occurs automatically. So, it is unnecessary to erase individual pages in advance.
- The FLASH control circuit incorporates an oscillator dedicated to the FLASH. So FLASH writing time is independent of the system clock frequency ( $f_c$ ). In addition, because an FLASH control circuit controls writing time for each FLASH cell, the writing time varies in each page (Typically 4 ms per page).
- Controlling the power for the FLASH control circuit (regulator and voltage step-up circuit) achieves low power consumption if the FLASH is not in use (Example. When the program is executed in RAM area).

### 1.1.2 Conditions for Accessing the FLASH Areas

The conditions for accessing the FLASH areas vary depending on each operation mode. The following tables shows FLASH are access conditions.

Table 1.1.1 FLASH Area Access Conditions

	Area	Operation Mode	
		MCU mode <sup>(Note 1)</sup>	Serial PROM mode <sup>(Note 2)</sup>
FLASH Memory	4000H to FFFFH	Read/Fetch only	Write/Read/Fetch supported

Note1: “MCU mode” shows NORMAL1/2 and SLOW1/2 modes.

Note2: “Serial PROM mode” shows the FLASH controlling mode. For details, refer to “2.1 Serial PROM mode”.

Note3: “Fetch” means reading operation of FLASH data as an instruction by CPU.

## 2.1 Serial PROM Mode

### 2.1.1 Outline

The TMP86FP24 has a 2 Kbytes BOOT-ROM for programming to FLASH memory. This BOOT-ROM is a mask ROM that contains a program to write the FLASH memory on-board. The BOOT-ROM is available in a serial PROM mode and it is controlled by BOOT pin (P23) and  $\overline{\text{RESET}}$  pin, and is communicated via TXD (P06) and RXD (P05) pins. There are four operation modes in a serial PROM mode: FLASH writing mode, RAM loader mode, FLASH memory SUM output mode and Product discrimination code output mode. Operating area of serial PROM mode differs from that of MCU mode. The operating area of serial PROM mode shows in Table 2.1.1.

Table 2.1.1 Operating Area of Serial PROM Mode

Parameter	Min	Max	Unit
Operating voltage	2.7	3.6	V
High frequency <sup>(Note)</sup>	2	16	MHz
Temperature	25 ± 5		°C

Note: Even though included in above operating area, part of frequency can not be supported in serial PROM mode. For details, refer to Table 2.1.4.

### 2.1.2 Memory Mapping

The BOOT-ROM is mapped in address 3800H to 3FFFH. The Figure 2.1.1 shows a memory mapping.

Figure 2.1.1 Memory Address Maps

### 2.1.3 Serial PROM Mode Setting

#### 2.1.3.1 Serial PROM Mode Control Pins

To execute on-board programming, start the TMP86FP24 in serial PROM mode. Setting of a serial PROM mode is shown in Table 2.1.2.

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Note: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

Recommended Operating Condition-2 (Serial PROM mode) ( $V_{SS} = 0\text{ V}$ ,  $T_{opr} = 25^{\circ}\text{C} \pm 5^{\circ}\text{C}$ )

Parameter	Symbol	Pins	Condition	Min	Max	Unit

Note 2: Input current (I<sub>IN1</sub>, I<sub>IN2</sub>): The current through pull-up or pull-down resistor is not included.

Note 3: I<sub>DD</sub> does not include I<sub>REF</sub> current.

Note 4: The supply currents of SLOW 2 and SLEEP 2 modes are equivalent to IDLE0, 1, 2.

Note 5: Current capacity indicates the drop in pin V3 output voltage per 1 $\mu$ A. Select an appropriate booster frequency setting in LCDCCR<VFSEL> according to LCD panel. To maintain stable operation, the current capacity for the reference pin must be more than ten times that of the output current capacity.

Note 6: MNP (MNPWDW) shows bit0 in EEPCR register and ATP (ATPWDW) shows bit1 in EEPCR register.

Note 7: "Fetch" means reading operation of FLASH data as an instruction by CPU.

Total error			–	–	±4	

Note 1: The total error includes all errors except a quantization error, and is defined as a maximum deviation from the ideal conversion line.

Note 2: Conversion time is different in recommended value by power supply voltage.  
About conversion time, please refer to “2.12.2 Register Configuration”.

Note 3: Please use input voltage to AIN input Pin in limit of V<sub>AREF</sub> − V<sub>SS</sub>.  
When voltage of range outside is input, conversion value becomes unsettled and gives affect to other channel conversion value.

Note 4: Analog Reference Voltage Range: ΔV<sub>AREF</sub> = V<sub>AREF</sub> − V<sub>SS</sub>.

Note 5: When AD is used with V<sub>DD</sub> < 2.0 V, the guaranteed temperature range varies with the operating voltage.

Note 6: When AD converter is not used, fix the A<sub>VDD</sub> pin on the V<sub>DD</sub> level.
