Preface

Thank you very much for making use of Toshiba microcomputer LSIs.
Before use this LSI, refer the section, "Points of Note and Restrictions".
Especially, take care below cautions.

****CAUTION****

How to release the HALT mode

Usually, interrupts can release all halts status. However, the interrupts = ($\overline{\text{NMI}}$, INT0), which can release the HALT mode may not be able to do so if they are input during the period CPU is shifting to the HALT mode (for about 3 clocks of X1) with IDLE or STOP mode. (In this case, an interrupt request is kept on hold internally.)

If another interrupt is generated after it has shifted to HALT mode completely, halt status can be released without difficulty. The priority of this interrupt is compare with that of the interrupt kept on hold internally, and the interrupt with higher priority is handled first followed by the other interrupt.

3. Operation

This section describes in blocks the functions and basic operations of TMP96C141BF device.

Check the 「7. Care Points and Restriction」 because of the Care Points etc are described.

3.1 CPU

TMP96C141BF device has a built-in high-performance 16-bit CPU (900-CPU). (For CPU operation, see TLCS-900 CPU in the previous section.)

This section describes CPU functions unique to TMP96C141BF that are not described in the previous section.

3.1.1 Reset

To reset the TMP96C141BF, the $\overline{\text{RESET}}$ input must be kept at 0 for at least 10 system clocks (10 states: $1\mu\text{s}$ with a 20 MHz system clock) within an operating voltage range and with a stable oscillation.

When reset is accepted, the CPU sets as follows:

- Program counter (PC) to 8000H.
- Stack pointer (XSP) for system mode to 100H.
- SYSM bit of status register (SR) to 1. (Sets to system mode.)
- IFF2 to 0 bits of status register to 111. (Sets mask register to interrupt level 7.)
- MAX bit of status register to 0. (Sets to minimum mode)
- Bits RFP2 to 0 of status register to 000. (Sets register banks to 0.)

When reset is released, instruction execution starts from address 8000H. CPU internal registers other than the above are not changed.

When reset is accepted, processing for built-in I/Os, ports, and other pins is as follows

- Initializes built-in I/O registers as per specifications.
- Sets port pins (including pins also used as built-in I/Os) to general-purpose input/output port mode (sets I/O ports to input ports).
- Sets the $\overline{\text{WDTOUT}}$ pin to 0. (Watchdog timer is set to enable after reset.)
- Pulls up the CLK pin to 1.
- Sets the ALE pin to 0.

3.2 Memory Map

Figure 3.2 is a memory map of the TMP96C141B.

Note : The start address after reset is 8000H. Resetting sets the stack pointer (XSP) on the system mode side to 100H.

4.8 Timing Chart for I/O Interface Mode

4.9 Timing Chart for Bus Request ($\overline{\text{BUSRQ}}$) / BUS Acknowledge ($\overline{\text{BUSAK}}$)

Symbol	Parameter	Variable		16 MHz		20 MHz		Unit
		Min	Max	Min	Max	Min	Max	
t_{BRC}	$\overline{\text{BUSRQ}}$ set-up time for CLK	120		120		120		ns
t_{CBAL}	CLK $\rightarrow$ $\overline{\text{BUSAK}}$ falling edge		$2.0x + 120$		245		220	ns
t_{CBAH}	CLK $\rightarrow$ $\overline{\text{BUSAK}}$ rising edge		$0.5x + 40$		71		65	ns
t_{ABA}	Output Buffer is off to $\overline{\text{BUSAK}}$	0	80	0	80	0	80	ns
t_{BAA}	$\overline{\text{BUSAK}}$ to Output buffer is on.	0	80	0	80	0	80	ns

Note 1: The Bus will be released after the $\overline{\text{WAIT}}$ request is inactive, when the $\overline{\text{BUSRQ}}$ is set to "0" during "Wait" cycle.

Note 2: The internal programmable pull-down resistance is attached.

Note 3: The internal programmable pull-up resistance is attached.

$\overline{\text{CS2}}/\overline{\text{CAS2}}$ pin doesn't have programmable resistance. But pull-up resistance is attached, when bus is released.
