

HCF4055B

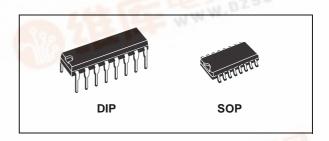

BCD TO 7 SEGMENT LIQUID CRYSTAL DISPLAY DECODER/DRIVER WITH DISPLAY FREQUENCY OUTPUT

- QUIESCENT CURRENT SPECIF. UP TO 20V
- OPERATION OF LIQUID CRYSTALS WITH CMOS CIRCUITS PROVIDES ULTRA LOW POWER DISPLAYS
- EQUIVALENT AC OUTPUT DRIVE FOR LIQUID CRYSTAL DISPLAYS - NO EXTERNAL CAPACITOR REQUIRED
- VOLTAGE DOUBLING ACROSS DISPLAY

 [(V_{DD} V_{EE}) = 18V] RESULTS IN EFFECTIVE
 36V (p-p) DRIVE ACROSS SELECTED
 DISPLAY SEGMENTS
- LOW OR HIGH OUTPUT LEVEL DC DRIVE FOR OTHER TYPES OF DISPLAYS
- ONE CHIP LOGIC LEVEL CONVERSION FOR DIFFERENT INPUT AND OUTPUT LEVEL SWINGS
- FULL DECODING OF ALL INPUT COMBINATIONS: "0 - 9, L, H, P, A" AND BLANK POSITIONS
- INPUT LEAKAGE CURRENT I_I = 100nA (MAX) AT V_{DD} = 18V T_A = 25°C
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC JESD13B "STANDARD SPECIFICATIONS FOR DESCRIPTION OF B SERIES CMOS DEVICES"

DESCRIPTION

HCF4055B is a monolithic integrated circuit fabricated in Metal Oxide Semiconductor technology available in DIP and SOP packages.

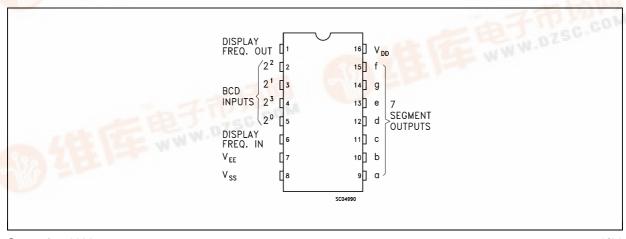

ORDER CODES

| PACKAGE | TUBE | T & R |
|---------|------------|---------------|
| DIP | HCF4055BEY | M. Add |
| SOP | HCF4055BM1 | HCF4055M013TR |

HCF4055B is a single digit BCD to 7 segment decoder driver circuit that provides a level shifting function on the chip. This feature permits the BCD input-signals swings (V_{DD} to V_{SS}) to be the same as or different from the 7-segment output signal swings (V_{DD} to V_{EE}). For example, the BCD input-signal swings (V_{DD} to V_{SS}) may be as low as 0 to -3V, whereas the output-display drive signal swing (V_{DD} to V_{EE}) may be from 0 to -5V. If V_{DD} to V_{EE} exceeds 15V, V_{DD} to V_{SS} should be at least 4V. The 7 segment outputs are controlled by the DISPLAY-FREQUENCY (DF) input, which causes the selected segment outputs to be low, high, or a square wave output (for liquid crystal displays).

PIN CONNECTION

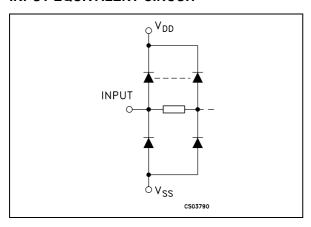

September 2002 1/11

When the DF input is low, the output segments will be high when selected by the BCD inputs. When the DF input is high, the output segments will be low when selected by the BCD inputs. When a square wave is present at the DF input, the selected segments will have a square wave output that is 180° out of phase with the DF input. Those segments which are not selected will have a square wave output that is in phase with the input. DF square wave repetition rates for liquid crystal displays usually range from 30Hz (well above flicker rate) to 200Hz (well below the upper limit of the liquid crystal frequency response). HCF4055B provides a level-shifted high amplitude DF output, which is required for driving the common electrode

in liquid crystal displays. The decoding of all input combinations in this device provides displays of 0 to 9 as well as L, P, H, A, -, and a blank position. The level shifted function permits the use of different input and output signal swings. The input swings from a low level of V_{SS} to a high level of V_{DD} while the outputs swing from a low level of V_{EE} to the same high level of V_{DD} . Thus, the input and output swings can be selected independently of each other over a 3 to 18V range. V_{SS} may be connected to V_{EE} when no level-shift function is required. Whenever the level-shifting function is required HCF4055B can be used by itself to drive a liquid crystal display (see Figure 3 and 4).

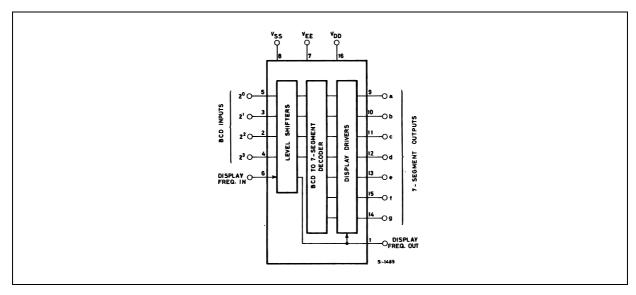

INPUT EQUIVALENT CIRCUIT

PIN DESCRIPTION

| PIN No | SYMBOL | NAME AND FUNCTION |
|------------------------------|-------------------------------|--------------------------|
| 5, 3, 2, 4 | 2^0 , 2^1 , 2^2 , 2^3 | BCD Inputs |
| 9, 10, 11, 12, 13, 15, 14 | a to g | 7 - Segments Outputs |
| 6 | DISPLAY FREQ. IN | Display Frequency Input |
| 1 | DISPLAY FREQ. OUT | Display Frequency Output |
| 7 | V _{EE} | Negative Supply Voltage |
| 8 | V_{SS} | Negative Supply Voltage |
| 16 | V_{DD} | Positive Supply Voltage |
