

ARA1400/ARA1400I

Reverse Amplifier with Step Attenuator Data Sheet - Rev 2.0

FEATURES

- Low cost integrated monolithic GaAs amplifier with step attenuator
- Attenuation Range: 0-56 dB, adjustable in 4dB increments via a 4 wire parallel control
- Meets DOCSIS distortion requirements at +60dBmV output signal level
- Low distortion and low noise
- Frequency range: 5-100MHz
- 5 Volt operation
- -40 to +85 °C or 0 to +85 °C temperature range options available

APPLICATIONS

- MCNS/DOCSIS Compliant Cable Modems
- CATV Interactive Set-Top Box
- Telephone over Cable Systems
- OpenCable Set-Top Box
- Residential Gateway

PRODUCT DESCRIPTION

The ARA1400 and the ARA1400I are GaAs ICs designed to provide the reverse path amplification and output level control functions in a CATV Set-Top Box or Cable Modem. Each incorporates a digitally controlled precision step attenuator that is preceded by an ultra low noise amplifier stage, and followed by an ultra-linear output driver amplifier. These devices are capable of meeting the MCNS/DOCSIS requirements for harmonic performance at a +60dBmV output level while requiring only a single

polarity +5V supply. On each device, both the input and the output are single-ended and matched to 75 Ohms, and a precision attenuator provides up to 56 dB of attenuation in 4 dB increments. Both devices are offered in a 28-pin SSOP package featuring a heat slug on the bottom of the package. Two temperature range options are available: the ARA1400 for commercial applications, and the ARA1400I for industrial applications.

13	32 dB	32 dB Attenuation Control Bit	27	I _{SET2}	Amplifier A2 Current Adjust
14	16 dB	16 dB Attenuation Control Bit	28	ATT _{OUT}	Attenuator Output ⁽²⁾

Notes:

(1) All N/C pins should be grounded.

(2) Pins should be AC-coupled. No external DC bias should be applied.

(3) Pins should be AC-grounded. No external DC bias should be applied.

(4) Pins should be AC-coupled from the RF path, and should be pulled to ground through a resistor.

ELECTRICAL CHARACTERISTICS

Table 2: Absolute Minimum and Maximum Ratings

PARAMETER	MIN	MAX	UNIT
Analog Supply: V_{SUP} (pins 4, 12, 17)	0	9	VDC
Amplifier Reference Voltages (pins 5, 18)	-2.5	$\frac{V_{SUP}}{2}$	VDC
RF Power at Amplifier Inputs (pins 10, 26)	-	+60	dBmV
Attenuator Controls (pins 13, 14, 15, 16)	0	6	V
Output Switch Control (pin 25)	0	6	V
Storage Temperature	-55	+200	°C
Soldering Temperature	-	260	°C
Soldering Time	-	5	Sec

Stresses in excess of the absolute ratings may cause permanent damage. Functional operation is not implied under these conditions. Exposure to absolute ratings for extended periods of time may adversely affect reliability.

Notes:

1. Pins 3, 19, and 28 should be AC-coupled. No external DC bias should be applied.
2. Pins 11 and 27 should be grounded or pulled to ground through a resistor. No external DC bias should be applied.
3. Pins 6, 7, 8, 9, 20, 21, 22, 23 and 24 should be AC-grounded. No external DC bias should be applied.
4. Pins 10 and 26 should be AC-coupled from the RF path, and should be pulled to ground through a resistor.

Table 3: Operating Ranges

PARAMETER	MIN	TYP	MAX	UNIT
Amplifier Supply: V_{DD} (pins 4, 17)	4.5	5	7	VDC
Attenuator Supply: V_{ATTN} (pin 12)	$V_{DD}-0.5$	5	7	VDC
Attenuator Controls (pins 13, 14, 15, 16)	0	-	5.5	V
Amplifier Reference Voltages (pins 5, 18)	-	1.75	-	VDC
Output Switch Control (pin 25)	0	-	5.5	V
Case Temperature - ARA1400 - ARA1400I	0 -40	25 25	85 85	°C

The device may be operated safely over these conditions; however, parametric performance is guaranteed only over the conditions defined in the electrical specifications.

 Output Switch Open: Output Switch Control = +5 V

Figure 4: Test Circuit

ARA1400/ARA1400I

APPLICATION INFORMATION

Amplifier Enable / Disable

The ARA1400 and the ARA1400I include two amplification stages that each can be shut down through external control pins V_{REF1} and V_{REF2} (pins 5 and 18, respectively.) By applying a typical bias of 1.75 Volts to these pins, the amplifiers are enabled. In order to fully disable an amplifier, its control pin requires a negative bias of -1.5 to -2.0 Volts.

Output Switch Control

A switch located at the output of Amplifier A2 in the ARA1400 and the ARA1400I provides isolation without having to disable the amplifiers. The switch is controlled by the Tx logic input (pin 25.)

Amplifier Bias Current

The I_{SET} pins (11 and 27) set the bias current for the amplification stages. Grounding these pins results in the maximum possible current. By placing a resistor from the pin to ground, the current can be reduced. The recommended bias conditions use the configuration shown in the test circuit schematic in Figure 4.

Thermal Layout Considerations

The device package for the ARA1400 and the ARA1400I features a heat slug on the bottom of the package body. Use of the heat slug is an integral part of the device design. Soldering it to the ground plane of the PC board will ensure the lowest possible thermal resistance for the device, and will result in the longest MTF (mean time to failure.)

A PC board layout that optimizes the benefits of the heat slug is shown in Figure 5. The via holes located under the body of the device must be plated through to a ground plane layer of metal, in order to provide sufficient thermal conductivity. The recommended solder mask outline is shown in Figure 6.

ESD Sensitivity

Electrostatic discharges can cause permanent damage to these devices. Electrostatic charges accumulate on test equipment and the human body, and can discharge without detection. Proper precautions and handling are strongly recommended. Refer to the ANADIGICS application note on ESD precautions.

COMPONENT PACKAGING

Volume quantities of the ARA1400 and the ARA1400I are supplied on tape and reel. Each reel holds 3,500 pieces. Smaller quantities are available in plastic tubes of 50 pieces.
