

3-Pin, Ultra-Low-Power SC70 Voltage Detectors

MAX6375-MAX6380

General Description

The MAX6375–MAX6380 are ultra-low-power circuits used for monitoring battery, power-supply, and regulated system voltages. Each detector contains a precision bandgap reference, comparator, and internally trimmed resistors that set specified trip threshold voltages. These devices provide excellent circuit reliability and low cost by eliminating external components and adjustments when monitoring nominal system voltages from 2.5V to 5V.

These circuits perform a single function: they assert an output signal whenever the V_{CC} supply voltage falls below a preset threshold. The devices are differentiated by their output logic configurations and preset threshold voltages. The MAX6375/MAX6378 (push-pull) and MAX6377/MAX6380 (open-drain) have an active-low output (\overline{OUT} is logic low when V_{CC} is below V_{TH}). The MAX6376/MAX6379 have an active-high push-pull output (OUT is logic high when V_{CC} is below V_{TH}). All parts are guaranteed to be in the correct output logic state for V_{CC} down to 1V. The detector is designed to ignore fast transients on V_{CC} . The MAX6375/MAX6376/MAX6377 have voltage thresholds between 2.20V and 3.08V in approximately 100mV increments. The MAX6378/MAX6379/MAX6380 have voltage thresholds between 3.30V and 4.63V in approximately 100mV increments.

Ultra-low supply current of 500nA (MAX6375/MAX6376/MAX6377) makes these parts ideal for use in portable equipment. All six devices are available in space-saving SC70 packages.

Applications

- Precision Battery Monitoring
- Load Switching/Power Sequencing
- Power-Supply Monitoring in Digital/Analog Systems
- Portable/Battery-Powered Equipment

Selector Guide appears at end of data sheet.

Features

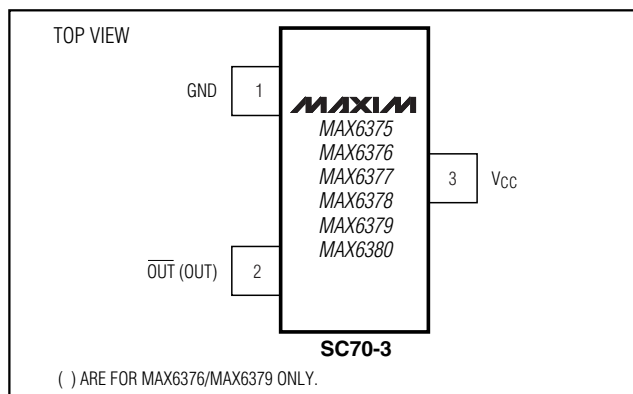

- ◆ Ultra-Low 500nA Supply Current (MAX6375/MAX6376/MAX6377)
- ◆ Thresholds Available from 2.20V to 4.63V in Approximately 100mV Increments
- ◆ $\pm 2.5\%$ Threshold Accuracy Over Temperature
- ◆ Low Cost
- ◆ Available in Three Versions: Push-Pull \overline{OUT} , Push-Pull OUT, and Open-Drain \overline{OUT}
- ◆ Power-Supply Transient Immunity
- ◆ No External Components
- ◆ 3-Pin SC70 Package

Ordering Information

PART [†]	TEMP. RANGE	PIN-PACKAGE
MAX6375XR__-T	-40°C to +85°C	3 SC70-3
MAX6376XR__-T	-40°C to +85°C	3 SC70-3
MAX6377XR__-T	-40°C to +85°C	3 SC70-3
MAX6378XR__-T	-40°C to +85°C	3 SC70-3
MAX6379XR__-T*	-40°C to +85°C	3 SC70-3
MAX6380XR__-T	-40°C to +85°C	3 SC70-3

[†]The MAX6375/MAX6376/MAX6377 are available in factory-preset thresholds from 2.20V to 3.08V, in approximately 0.1V increments. The MAX6378/MAX6379/MAX6380 are available in factory-preset thresholds from 3.30V to 4.63V, in approximately 0.1V increments. Choose the desired threshold suffix from Table 1 and insert it in the blank spaces following R. There are 21 standard versions, with a required order increment of 2500 pieces. Sample stock is generally held on the standard versions only (see the Selector Guide). The required order increment is 10,000 pieces for nonstandard versions (Table 2). Contact factory for availability. All devices available in tape-and-reel only.
*Future product—contact factory for availability.

Pin Configuration

3-Pin, Ultra-Low-Power SC70 Voltage Detectors

ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)		Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)
V_{CC}	-0.3V to +6V	3-Pin SC70 (derate 2.17mW/ $^\circ\text{C}$ above +70 $^\circ\text{C}$).....
$\overline{\text{OUT}}$, $\overline{\text{OUT}}$ (push-pull)	-0.3V to ($V_{CC} + 0.3\text{V}$)	174mW
$\overline{\text{OUT}}$ (open-drain)	-0.3V to +6V	Operating Temperature Range
Input Current (V_{CC}).....	20mA	-40 $^\circ\text{C}$ to +85 $^\circ\text{C}$
Output Current ($\overline{\text{OUT}}$, $\overline{\text{OUT}}$).....	20mA	Storage Temperature Range
		-65 $^\circ\text{C}$ to +150 $^\circ\text{C}$
		Junction Temperature
		+150 $^\circ\text{C}$
		Lead Temperature (soldering, 10s)
		+300 $^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = full range, $T_A = -40^\circ\text{C}$ to +85 $^\circ\text{C}$, unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$ and $V_{CC} = 3\text{V}$.) (Note 1)

Note 1: Production tested at +25 $^\circ\text{C}$ only. Overtemperature limits are guaranteed by design, not production tested.

3-Pin, Ultra-Low-Power SC70 Voltage Detectors

Typical Operating Characteristics

($V_{CC} = 5$, $T_A = +25^\circ\text{C}$, unless otherwise noted.)

Pin Description

PIN		NAME	FUNCTION
MAX6375/MAX6378 MAX6377/MAX6380	MAX6376 MAX6379		
1	1	GND	Ground
2	—	$\overline{\text{OUT}}$	Active-Low Output. $\overline{\text{OUT}}$ remains low while V_{CC} is below the threshold. $\overline{\text{OUT}}$ is open-drain on the MAX6377/MAX6380 and push-pull on the MAX6375/MAX6378.
—	2	OUT	Active-High Output. OUT remains high while V_{CC} is below the threshold.
3	3	V_{CC}	Supply Voltage

3-Pin, Ultra-Low-Power SC70 Voltage Detectors

Applications Information

Interfacing to Different Logic Voltage Components

The MAX6377/MAX6380 have an active-low, open-drain output. This output structure will sink current when $\overline{\text{OUT}}$ is asserted. Connect a pull-up resistor from $\overline{\text{OUT}}$ to any supply voltage up to 5.50V (Figure 1). Select a resistor value large enough to allow a valid logic low (see *Electrical Characteristics*), and small enough to register a logic high while supplying all input current and leakage paths connected to the $\overline{\text{OUT}}$ line.

Negative-Going Vcc Transients

These devices are relatively immune to short-duration, negative-going VCC transients (glitches). The *Typical Operating Characteristics* show the Maximum Transient Duration vs. Threshold Overdrive graph, for which output pulses are not generated. The graph shows the maximum pulse width that a negative-going VCC transient may typically have before the devices issue output signals. As the amplitude of the transient increases, the maximum-allowable pulse width decreases.
