## Multi-Bit Enhanced Noise Shaping 20-Bit ANALOG-TO-DIGITAL CONVERSION SYSTEM

### FEATURES

- **DUAL 20-BIT MONOLITHIC MODULATOR (PCM1760) AND MONOLITHIC DECIMATING DIGITAL FILTER (DF1760)**
- **HIGH PERFORMANCE:**  
THD+N: -92dB typ, -90dB max  
Dynamic Range: 108dB typ  
SNR: 108dB min, 110dB typ  
Channel Separation: 98dB typ, 94dB min
- **64X OVERSAMPLING**
- **CO-PHASE CONVERSION**
- **RUNS ON 256fs OR 384fs SYSTEM CLOCK**
- **VERSATILE INTERFACE CAPABILITY:**  
16-, 20-Bit Output  
MSB First or LSB First Format
- **OPTIONAL FUNCTIONS:**  
Offset Error Calibration  
Overflow Detection  
Power Down Mode (DF1760)
- **RUNS ON ±5V SUPPLIES (PCM1760) AND 5V SUPPLY (DF1760)**
- **COMPACT 28-PIN PACKAGES:**  
28-Pin DIP and SOIC

### DESCRIPTION

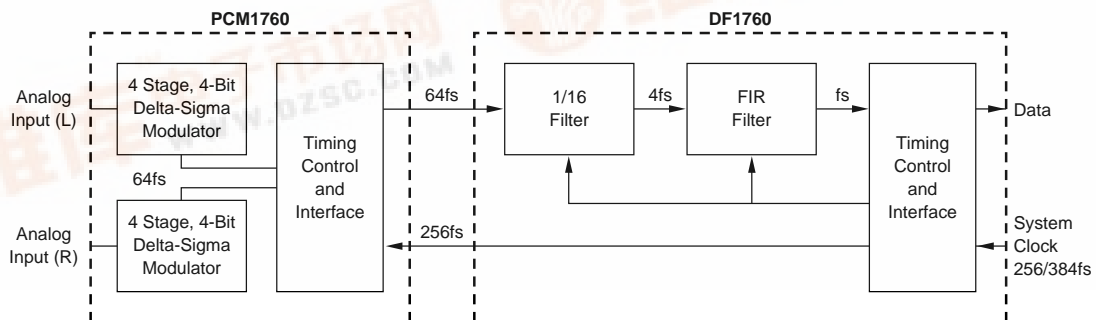

The PCM1760 and DF1760 combine for a low-cost, high-performance dual 20-bit, 48kHz sampling analog-to-digital conversion system which is specifically designed for dynamic applications.

The PCM1760/DF1760 pair form a 4-bit, 4th order, 64X oversampling analog-to-digital converter.

The PCM1760 is a delta-sigma modulator that uses a 4-bit quantizer within the modulation loop to achieve very high dynamic range.

The DF1760 is a high-performance decimating digital filter. The DF1760 accepts 4-bit 64fs data from the PCM1760 and decimates to 20-bit 1fs data.

The FIR filter of the DF1760 has pass-band ripple of less than ±0.001dB and greater than 100dB of the reject band attenuation.

### PIN ASSIGNMENTS DF1760

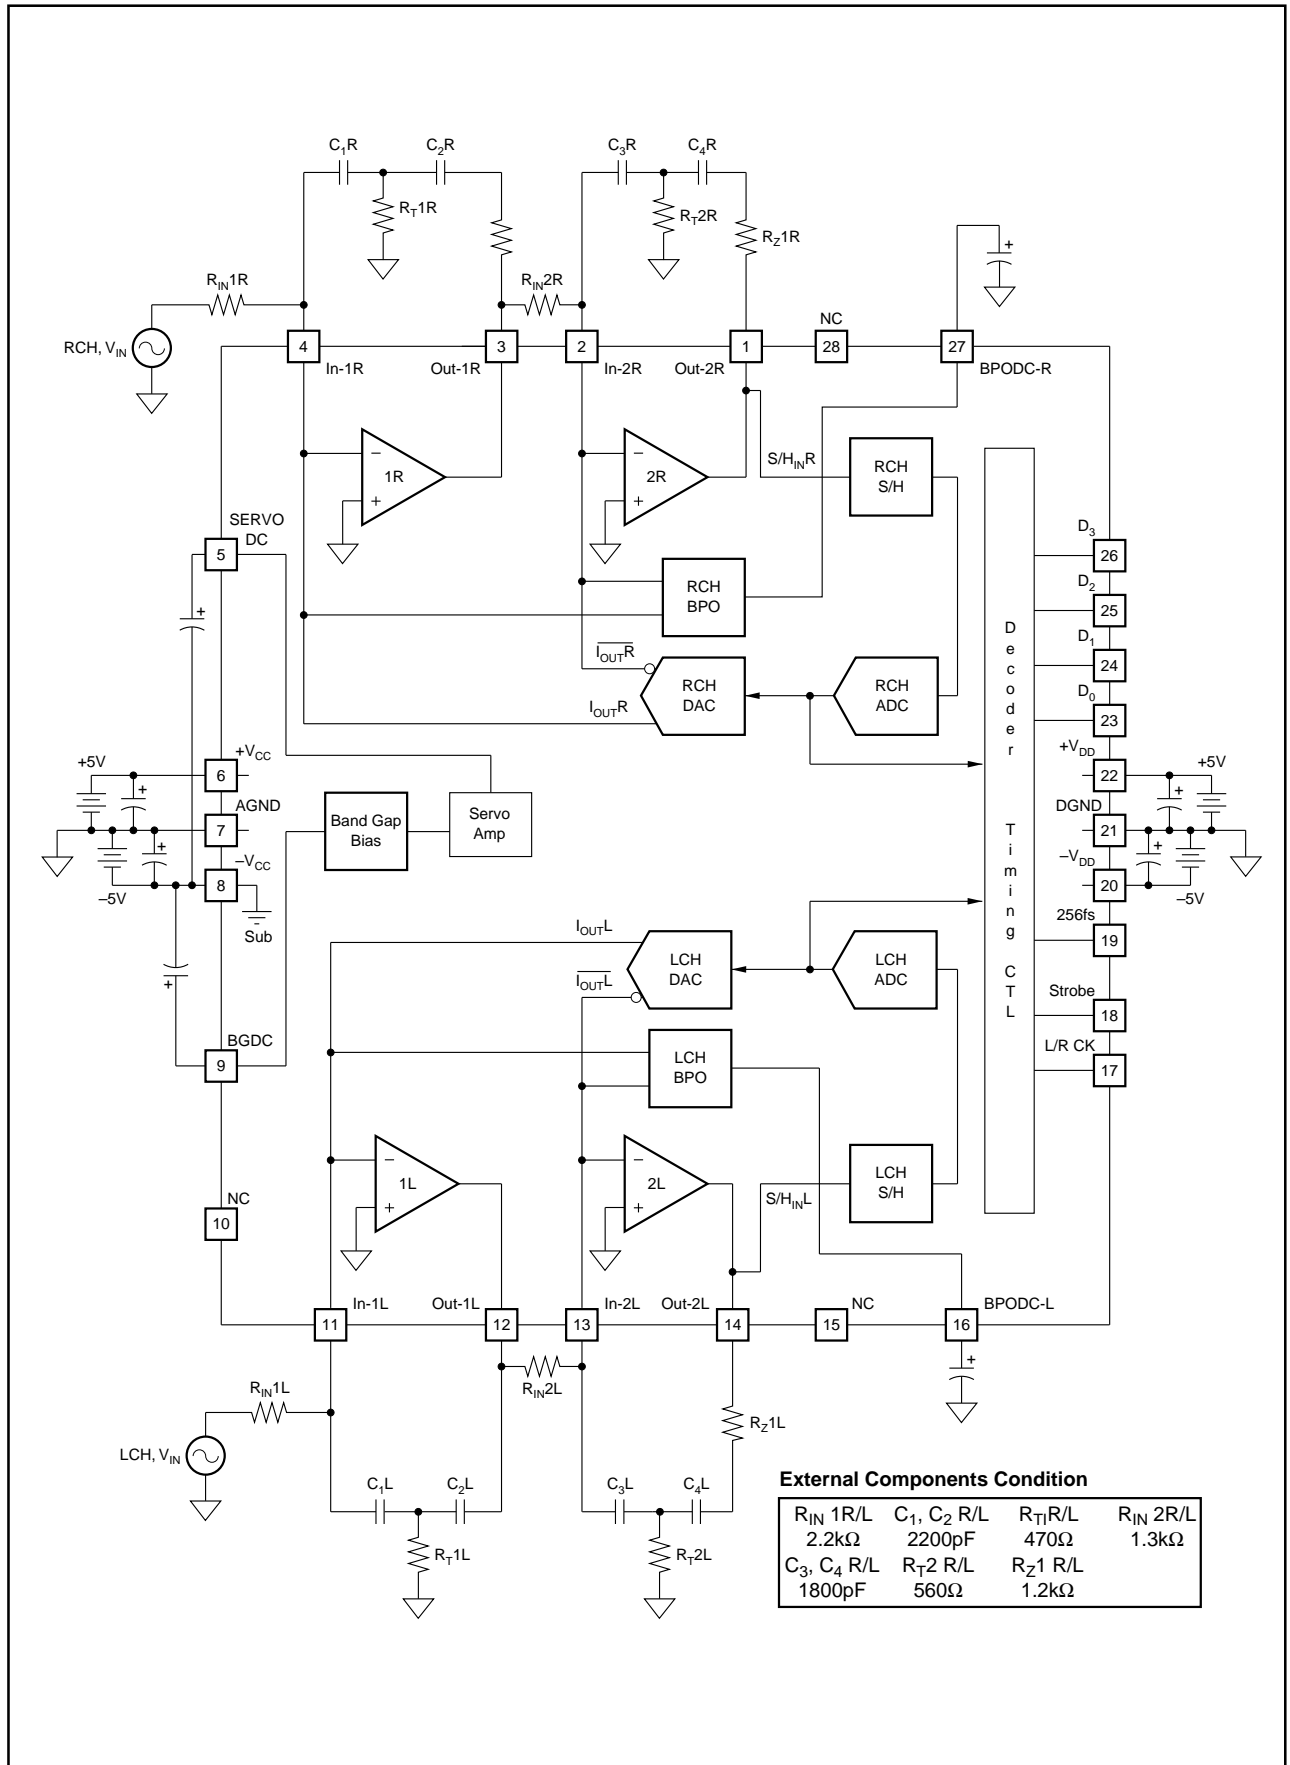

PIN	I/O <sup>(1)</sup>	NAME	DESCRIPTION
1	O	OVL	Left Channel Overflow Output (Active High)
2	O	OVR	Right Channel Overflow Output (Active High)
3	I	D <sub>3</sub>	D3 Data Input (MSB)
4	I	D <sub>2</sub>	D2 Data Input
5	I	D <sub>1</sub>	D1 Data Input
6	I	D <sub>0</sub>	D0 Data Input (LSB)
7	-	TP1	Test Pin (No Connection)
8	-	V <sub>SS1</sub>	Common Channel 1
9	-	V <sub>DD1</sub>	+5V Channel 1
10	O	256fs	256fs Clock Output
11	I	Strobe	Data Strobe Clock Input (128fs)
12	I	LRCK	LR Clock Input
13	I↑	CALD	Calibration Function Enable (Active Low)
14	O	CAL	Calibration Output (High During Calibration)
15	I	SYSCLK	System Clock Input (256fs or 384fs)
16	I↑/O	SCLK	Data Clock
17	I↑/O	L/R	LR Channel Phase Clock
18	O	SDATA	Serial Data Output (1fs)
19	I↑/O	FSYNC	Frame Clock (2fs)
20	I↑	LRSC	Phase Control of LR Channel Phase Clock
21	I↑	/PD	Power Down Mode Enable Input (Active Low)
22	I↑	Mode2	Output Format Selection Input 2
23	I↑	Mode1	Output Format Selection Input 1
24	I↑	S/M	Slave/Master Mode Selection Input (High Makes Slave Mode)
25	I↑	CLKSEL	System Clock Selection Input (High Makes 256fs)
26	-	TP2	Test Pin (No Connection)
27	-	V <sub>DD2</sub>	+5V Channel 2
28	-	V <sub>SS2</sub>	Common Channel 2

NOTE: (1) O = Output terminal; I = Input terminal.

TYPICAL FFT ANALYSIS OF THE 1kHz fs INPUT SIGNAL

# BASIC CONNECTION DIAGRAM OF PCM1760 AND DF1760

# FUNCTIONS OF THE DIGITAL FILTER

## SYSTEM CLOCK

The DF1760 can accept a system clock of either 256fs or 384fs. If a 384fs system clock is used, the DF1760 divides by 2/3 to create the 256fs system clock required for the PCM1760. The system clock is applied to pin 15 (SYSCLK input). The actual clock selection is done by setting pin 25 (CLKSEL input) “high” for 256fs clock and “LOW” for 384fs clock.

The detailed timing requirements for the system clock are shown in Figure 3c.

CLKSEL	SYSCLK
H	256fs
L	384fs

## MASTER/SLAVE MODE

The DF1760 can be used in both the master mode and slave mode. In the master mode, the DF1760 outputs L/R (left/right channel phase clock), SCLK (data clock) and FSYNC (frame clock 2fs) signals. In the slave mode, the DF1760 accepts L/R, SCLK and FSYNC signals. The mode selection is done by taking pin 24 (S/M INPUT) “HIGH” for slave mode and “LOW” for master mode.

S/M	MODE
H	Slave
L	Master

## OUTPUT DATA FORMAT

The serial output data has four possible formats. The selection of the formats can be done by the Mode 1 and Mode 2 inputs.

MODE 1	MODE 2	FORMATS
H	H	MSB First, 16 Bits, Falling Edge
L	H	MSB First, 20 Bits, Falling Edge
H	L	MSB First, 20 Bits, Rising Edge
L	L	LSB First, 20 Bits, Falling Edge

## LR CHANNEL PHASE CLOCK

The status of the LR channel phase clock can be set by the LRSC input.

LRSC	L/R CLOCK AND CHANNEL
H	H = LCH, L = RCH
L	L = LCH, H = RCH

## OVERFLOW DETECTION

When a near-to-clipping input condition is detected, OVL output (Pin 1), or OVR output (Pin 2), becomes “HIGH” for a duration of 4096/fs (about 85ms) depending upon on the channel detected.

The OVL and OVR output return to “LOW” after 4096/fs duration automatically.

## OFFSET CALIBRATION MODE

The offset error is calibrated by storing the digital data when the input is zero in registers and subtracting it from the future data with actual signal input.

CALD	CALIBRATION
H	Disable
L	Enable

To enable the calibration mode, set the CALD input (Pin 13) “LOW”. The calibration mode is disabled by setting the CALD input (Pin 13) “HIGH”. The calibration cycle is initiated by setting the /PD input (Pin 21) “LOW” for more than 2 system clock periods and then setting it “HIGH”. During the calibration cycle, the CAL output (Pin 14) becomes “HIGH”, all the serial data is forced to “LOW”, and the L/R (Pin 17), SCLK (Pin 16) and FSYNC (Pin 19) pins become input terminals after the completion of the calibration cycle. The CAL output is “LOW”.

## POWER DOWN MODE/RESET

The /PD input (Pin 21) has two functions. First, it should be set at “HIGH” after application or restoration of power ( $V_{SS}$  and/or  $V_{DD}$ ) to accomplish the power-on/mode reset function. The detail timing requirements for this function are shown in Figure 3f. Second, the DF1760 is placed in the power down mode by setting the /PD input (Pin 21) “LOW”. Set the /PD input (Pin 21) “HIGH” for normal operation mode.

/PD	OPERATION
H	Normal
L	Power Down

The power dissipation of the DF1760 in the power down mode is about 1/10 of the normal operation mode. During the power down mode, the L/R, SCLK, and FSYNC pins become input pins and all the serial data is forced “LOW”. The 256fs output is enabled even in the power down mode.

The detailed timing of the power down mode operation and the offset calibration is shown in Figure 3b.

# THEORY OF OPERATION

## MULTI-BIT ENHANCED NOISE SHAPING

A block diagram of a typical 1-bit delta-sigma modulator is shown in Figure 4.

In Figure 4, the quantizer consists of a single bit which has two possible states, either “0” or “1”. The input signal is sampled at a much higher sample rate than the nyquist sampling frequency. The quantizer output data stream is digitally filtered for higher resolution nyquist data. The theoretical SNR is determined by the number of the order of the integrator and the oversampling rate.

FIGURE 4. Single Stage 1-Bit Delta-Sigma.

FIGURE 5. Single Stage Multi-bit Delta-Sigma.

There is a practical limit to increasing the numbers of order of the integrator due to an inherent oscillation in the modulator. There is also a limit to increasing the sample rate due to the increase in jitter sensitivity associated with high clock frequencies.

The PCM1760 utilizes a four-bit quantizer instead of the conventional one-bit method. The quantizing noise of a four-bit quantizer is 1/16 of the one-bit version. Using the four-bit quantizer allows for a lesser order number of the integrator and a lower oversampling rate to achieve similar performance to that of a more complex one-bit system.

A block diagram of the PCM1760 modulator is shown in Figure 6. The PCM1760 is a fourth-order integrator that samples at 64x oversampling, and samples left and right channel input signal simultaneously.

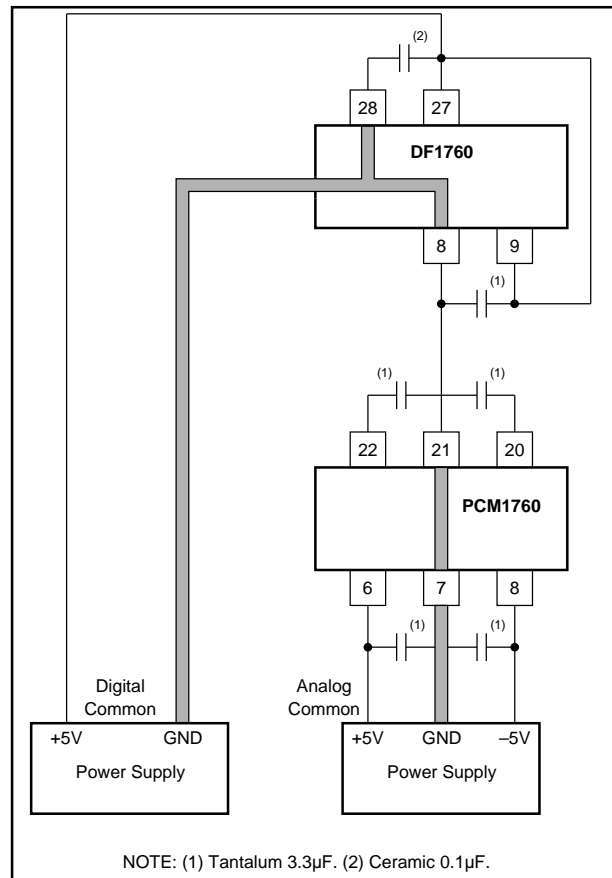

FIGURE 6. Multi-bit Enhanced Noise Shaping.

The DF1760 accepts the four-bit 64fs noise shaped data stream from the PCM1760 and decimates to 1/16 with an initial filter, and then decimates to 1fs 20-bit data using a 4x oversampling filter.

The PCM1760 and DF1760 combination achieves a dynamic range of 108dB and SNR of 110dB even with a single-ended input.

NOTE: (1) Tantalum 3.3µF. (2) Ceramic 0.1µF.

FIGURE 7. Recommended Power Supply Connection and Decoupling.

## LAYOUT PRECAUTIONS

Analog common and digital common of the PCM1760 are not connected internally. These should be connected together with the common of the DF1760 as close to the unit as possible, preferably to a large ground plane under the PCM1760.

The use of a separate +5V supply is recommended for the PCM1760 and DF1760, and to connect the common at one point as described above. Low impedance analog and digital commons returns are essential for better performance.

The power supplies should be bypassed with tantalum capacitors as close as possible to the units. See Figure 7 for recommended common connections and power supplies bypassing.

## OUTPUT TONE ELIMINATION

When the sampling frequency ( $f_s$ ) is between 40kHz and 50 kHz and the L/R relative offset voltage ( $\Delta V_s$ ) is less than or equal to 0.05% of full scale range, the PCM1760 may output a tone similar to an idle tone. This tone is very low and its frequency depends on the input L/R relative offset voltage,  $\Delta V_s$ . This tone never occurs when the sampling frequency ( $f_s$ ) is 32kHz.

To avoid this tone, the offset voltage should be summed using an amplifier, buffer, active low pass filter, etc., to cause the input L/R relative offset voltage ( $\Delta V_s$ ) to be greater than 0.05% of full scale range.

It is recommended that:

(A) Sum offset at both L/R channels

$$\text{Lch: } V_{IL} = -20\text{mV} \pm 10\%$$

$$\text{Rch: } V_{IR} = +10\text{mV} \pm 10\%$$

(B) Sum offset at L channel

$$\text{Lch: } V_{IL} = -30\text{mV} \pm 10\%$$

$$\text{Rch: } V_{IR} = \pm 1\text{mV (by a precircuit)}$$

When FSR = 5V ( $\pm 2.5\text{V}$ ).

Figure 8 shows an application circuit for summing the offset at both L/R channels.

Alternately, Figure 9 shows an application circuit for use when  $f_s = 48\text{kHz}$  which changes the external integrator circuit of the PCM1760.

## MODULATOR COMPONENTS AND SAMPLING FREQUENCY

The PCM1760/DF1760 are capable to 30kHz to 50kHz  $f_s$  sampling frequency by condition with external components value which are shown in Basic Connection Diagram.

The characteristics of the modulator's integrator can be set by external components. The values in the block diagram on page five are recommended for optimized performance. Low leakage, low voltage coefficient capacitors are recommended for integration capacitors.

The tolerance of external components should be better than  $\pm 2\%$ .

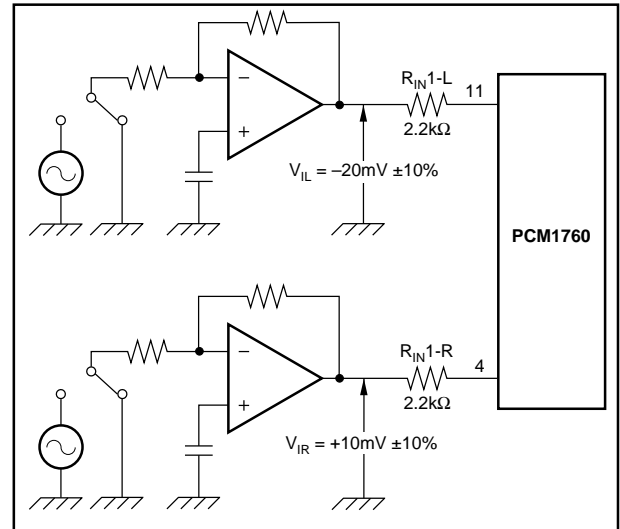

FIGURE 8. Application Example to Eliminate the Tone (offset voltage implementation for both channels).

## OFFSET ERROR CALIBRATION

The offset voltage of the PCM1760 and the input stage of the system can be compensated by using the calibration mode of the DF1760. Offset calibration is shown in Figure 10. An optional analog switch is driven by a CAL output of the DF1760. The PD input of the DF1760 is used to initiate the calibration cycle.

## ANALOG INPUT AND DIGITAL OUTPUT

Ideal output digital code range for 20-bit resolution is from 8000H (-Full Scale) to 7FFFFH (+Full Scale).

The DF1760, combined with 70000H ( $\pm \text{FSR}$ ) of the PCM1760, produces a digital output code range at  $\pm \text{FSR}$  input of 90000H (-FSR).

The relationship between analog input and digital output is shown in Table I.

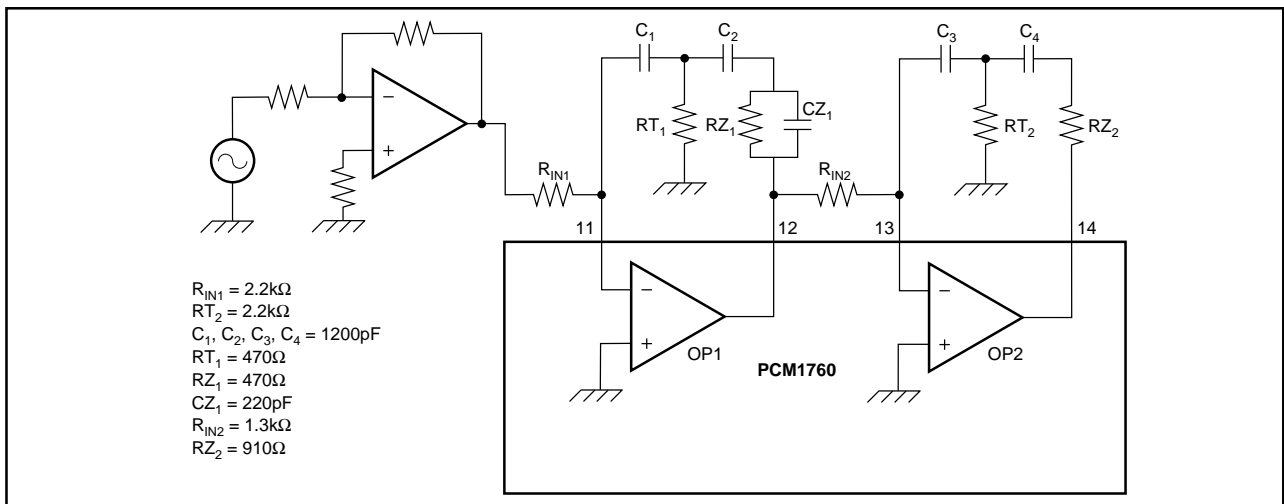

FIGURE 9. Application Example to Eliminate the Tone (alternative modulator's integrator circuit. Only for  $f_s = 48\text{kHz}$ ).

ANALOG INPUT	CONDITION	DIGITAL OUTPUT
+2.55V	+Max Input	72000H
+2.50V to +2.55V	Overflow	70000H to 72000H <sup>(2)</sup>
+2.50V	+FSR	70000H
0V	BPZ (Ideal)	00000H <sup>(1)</sup>
-2.50V	-FSR	90000H
-2.83V to -2.85V	Overflow	82FFFH to 82000H <sup>(2)</sup>
-2.85V	-Max Input	82000H

NOTES: (1) In case of BPZ Error = 0. (2) Overflow detection level is over 70000H or under 82FFFH of digital output code.

TABLE I. Output Codes.

### POWER SUPPLY SEQUENCING

The PCM1760 requires  $\pm V_{CC}$  and  $\pm V_{DD}$  power supplies. To avoid any possibility of latch-up, the  $\pm V_{CC}$  and  $\pm V_{DD}$  power should all be applied simultaneously or the  $+V_{CC}$  and  $+V_{DD}$  applied first followed by  $-V_{CC}$  and  $-V_{DD}$ .

### POWER-ON RESET AND MODE RESET

The timing requirements for POWER-ON RESET and MODE RESET are shown in Figure 3f. The DF1760 requires POWER-ON RESET when power is applied or restored. MODE RESET is required when any of the following has been changed: system clock, master/slave mode, output data format, L/R clock, calibration after POWER-ON in slave mode.

This reset should be done by holding the /PD input (pin 21) low for more than 2/fs. Suggested reset circuits are given in Figures 11, 12 and 13.

### CLOCK INPUT

After power is applied to the DF1760, the system clock should be provided continuously. The DF1760 employs a dynamic logic architecture.
