F²MC-8L MB89160L Series

MB89163L/165L/P165/W165/PV160

■ DESCRIPTION

The MB89160L series is a line of the general-purpose, single-chip microcontrollers. In addition to a compact instruction set, the microcontrollers contain a variety of peripheral functions such as an LCD controller/driver, an A/D converter, timers, a serial interface, PWM timers, and external interrupts.

■ FEATURES

- F²MC-8L family CPU core
- Dual-clock control system
- Maximum memory size: 16-Kbyte ROM, 512-byte RAM (Max)
- Minimum execution time: 0.95 µs/4.2 MHz
- I/O ports: Max 54 channels
- 21-bit time-base timer
- 8/16-bit timer/counter: 2 or 1 channels
- 8-bit serial I/O: 1 channel
- External interrupts (wake-up function): Four channels with edge detection plus eight level-interrupt channels
- 8-bit A/D converter: 8 channels
- 8-bit PWM timers: 2 channels
- Watch prescaler (15 bits)
- LCD controller/driver: 24 segments × 4 commons (Max 96 pixels)
- Remote control transmission output
- Buzzer output
- Power-on reset function (option)
- Low-power consumption modes (stop, sleep, and watch mode)
- CMOS technology

■ DIFFERENCES AMONG PRODUCTS

1. Memory Size

Before evaluating using the piggyback product, verify its differences from the product that will actually be used. Take particular care on the following points:

- On the MB89163L, addresses 0180_H and later of the register bank cannot be used.
- The stack area, etc., is set at the upper limit of the RAM.

2. Current Consumption

- In the case of the MB89PV160, add the current consumed by the EPROM which is connected to the top socket.
- When operated at low speed, the product with an OTPROM (one-time PROM) or an EPROM will consume more current than the product with a mask ROM.
  However, the current consumption in the sleep/stop modes is the same. (For more information, see ■ ELECTRICAL CHARACTERISTICS.)

3. Mask Options

Functions that can be selected as options and how to designate these options vary by the product.

Before using options check ■ MASK OPTIONS.

Take particular care on the following points:

- A pull-up resistor cannot be set for P20 to P27, P40 to P47 and P60 to P67 on the MB89P165/W165.
- A pull-up resistor is not selectable for P40 to P47 and P60 to P67 if they are used as LCD pins.
- Options are fixed on the MB89PV160.

■ HANDLING DEVICES

1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than V_{CC} or lower than V_{SS} is applied to input and output pins other than medium- to high-voltage pins or if higher than the voltage which shows on "1. Absolute Maximum Ratings" in ■ ELECTRICAL CHARACTERISTICS is applied between V_{CC} and V_{SS}.

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

Also, take care to prevent the analog power supply (AV_{CC} and AVR) and analog input from exceeding the digital power supply (V_{CC}) when the analog system power supply is turned on and off.

2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

3. Treatment of Power Supply Pins on Microcontrollers with A/D and D/A Converters

Connect to be AV_{CC} = DAVC = V_{CC} and AV_{SS} = AVR = V_{SS} even if the A/D and D/A converters are not in use.

4. Treatment of N.C. Pin

Be sure to leave (internally connected) N.C. pins open.

5. Power Supply Voltage Fluctuations

Although V_{CC} power supply voltage is assured to operate within the rated range, a rapid fluctuation of the voltage could cause malfunctions, even if it occurs within the rated range. Stabilizing voltage supplied to the IC is therefore important. As stabilization guidelines, it is recommended to control power so that V_{CC} ripple fluctuations (P-P value) will be less than 10% of the standard V_{CC} value at the commercial frequency (50 Hz to 60 Hz) and the transient fluctuation rate will be less than 0.1 V/ms at the time of a momentary fluctuation such as when power is switched.

6. Precautions when Using an External Clock

Even when an external clock is used, oscillation stabilization time is required for power-on reset (optional) and wake-up from stop mode.

7. Note on Noise in the External Reset Pin ($\overline{RST}$)

If the reset pulse applied to the external reset pin ($\overline{RST}$) does not meet the specifications, it may cause malfunctions. Use caution so that the reset pulse less than the specifications will not be fed to the external reset pin ($\overline{RST}$) .

■ PROGRAMMING TO THE EPROM ON THE MB89P165

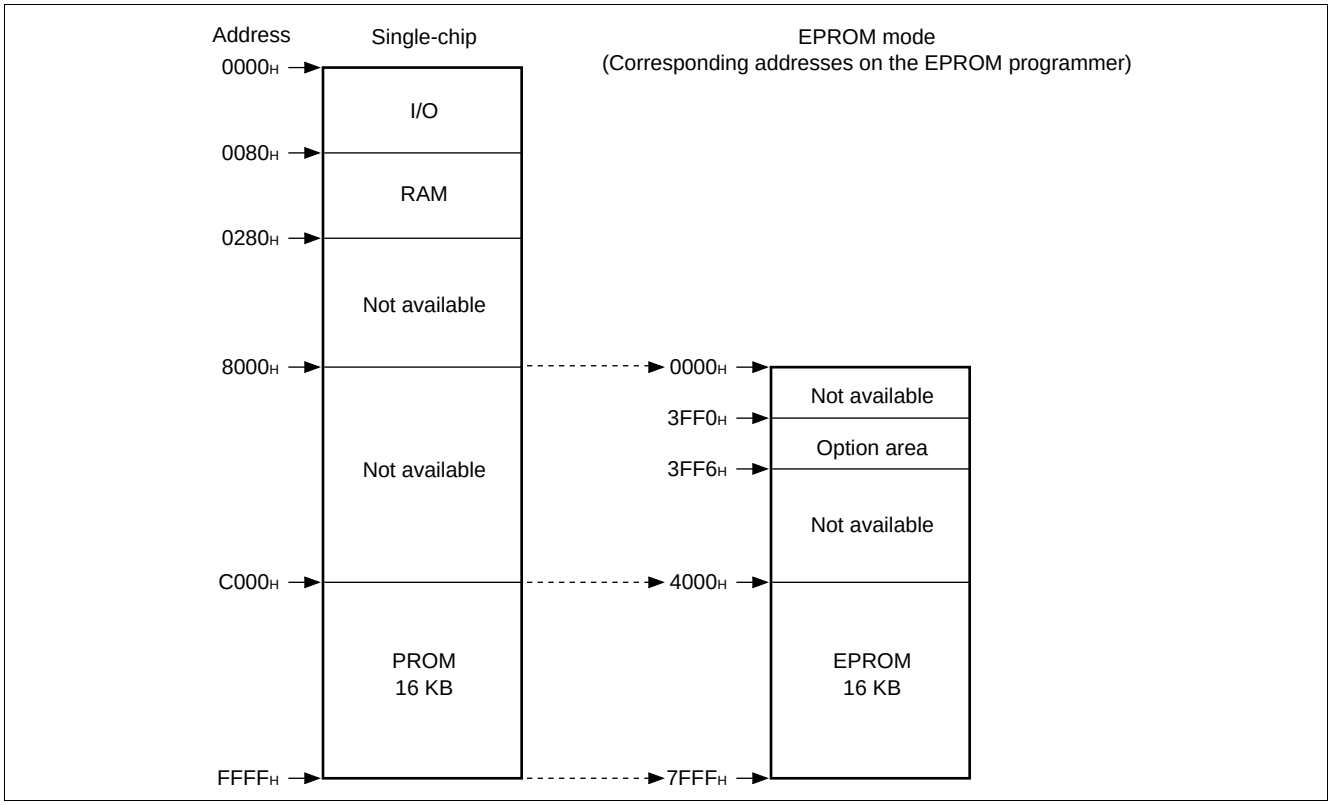
The MB89P165 is an OTPROM version of the MB89160 series.

1. Features

- 32-Kbyte PROM on chip
- Options can be set using the EPROM programmer.
- Equivalency to the MBM27C256A in EPROM mode (when programmed with the EPROM programmer)

2. Memory Space

Memory space in each mode such as 32-Kbyte PROM, option area is diagrammed below.



3. Programming to the EPROM

In EPROM mode, the MB89P165 functions equivalent to the MBM27C256A. This allows the PROM to be programmed with a general-purpose EPROM programmer (the electronic signature mode cannot be used) by using the dedicated socket adapter.

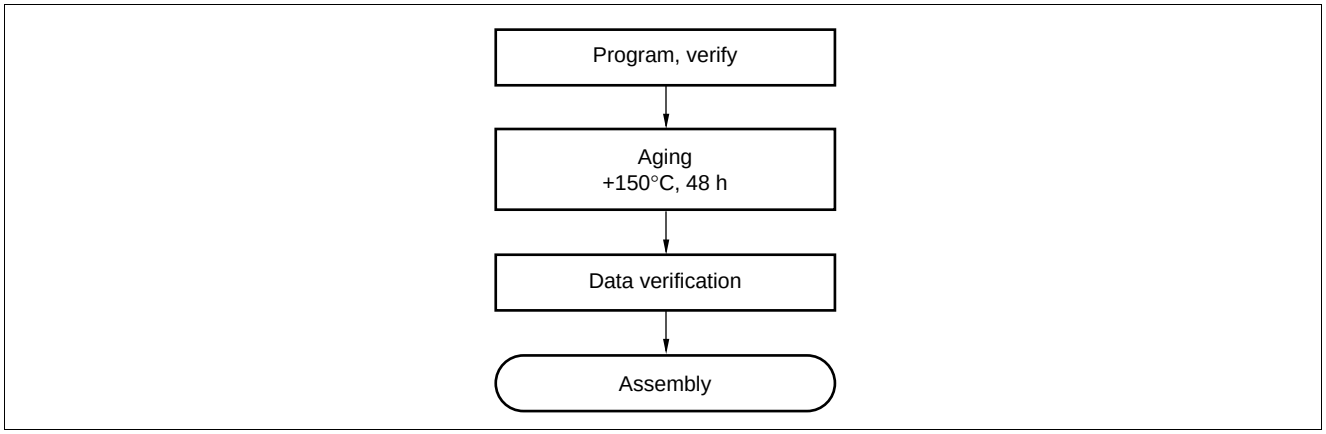
When the operating area for a single chip is 16 Kbyte ($C000_H$ to $FFFF_H$) the PROM can be programmed as follows:

- **Programming procedure**

(1) Set the EPROM programmer to the MBM27C256A.
(2) Load program into the EPROM programmer at 4000_H to $7FFF_H$.
(Note that addresses $C000_H$ to $FFFF_H$ while operating as a single chip assign to 4000_H to $7FFF_H$ in EPROM mode.)
Load option data into address $3FF0_H$ to $3FF5_H$ of the EPROM programmer.
(For information about each corresponding option, see “8. Setting OTPROM Options.”)
(3) Program with the EPROM programmer.

4. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.



5. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of 100% cannot be assured at all times.

6. EPROM Programmer Adapter Socket

Package	Compatible adapter socket
FPT-80P-M05	ROM-80SQF-28DP-8L
FPT-80P-M06	ROM-80QF-28DP-8L3
FPT-80P-M11	ROM-80QF2-28DP-8L2

7. Erasure

In order to clear all locations of their programmed contents, it is necessary to expose the internal EPROM to an ultraviolet light source. A dosage of 10 W-seconds/cm^2 is required to completely erase an internal EPROM. This dosage can be obtained by exposure to an ultraviolet lamp (wavelength of 2537 Angstroms (Å)) with intensity of 12000 μW/cm_2 for 15 to 21 minutes. The internal EPROM should be about one inch from the source and all filters should be removed from the UV light source prior to erasure.

It is important to note that the internal EPROM and similar devices, will erase with light sources having wavelengths shorter than 4000Å. Although erasure time will be much longer than with UV source at 2537Å, nevertheless the exposure to fluorescent light and sunlight will eventually erase the internal EPROM, and exposure to them should be prevented to realize maximum system reliability. If used in such an environment, the package windows should be covered by an opaque label or substance.

8. Setting OTPROM Options

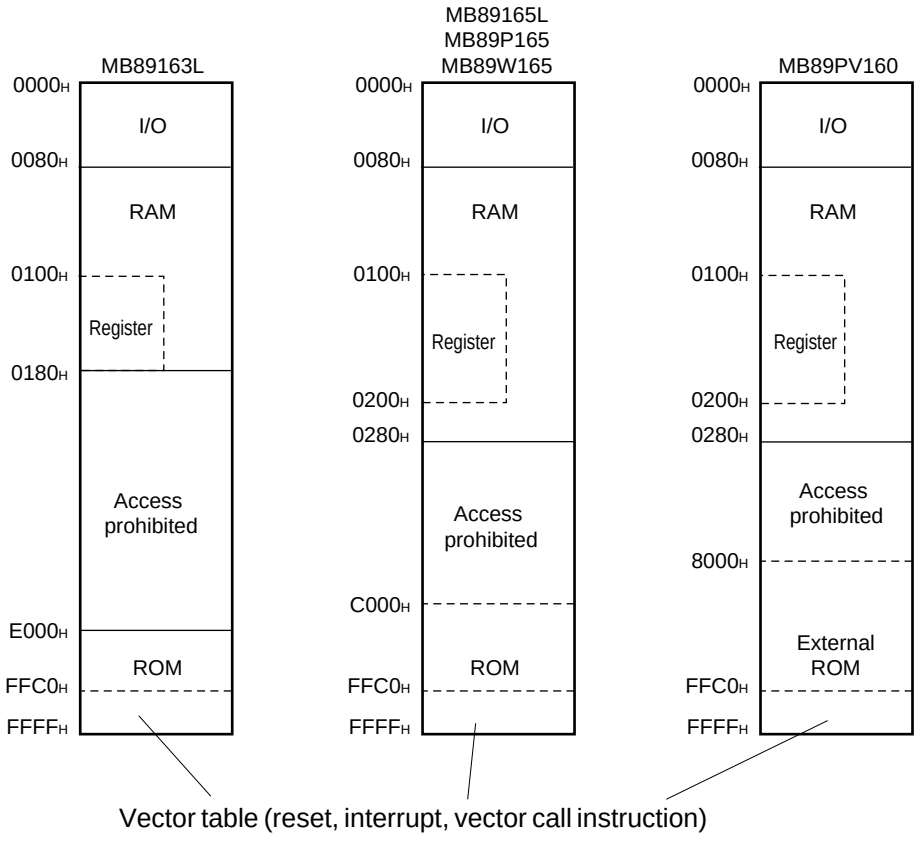
■ CPU CORE

1. Memory Space

The microcontrollers of the MB89160L series offer a memory space of 64 Kbytes for storing all of I/O, data, and program areas. The I/O area is located at the lowest address. The data area is provided immediately above the I/O area. The data area can be divided into register, stack, and direct areas according to the application. The program area is located at exactly the opposite end, that is, near the highest address. Provide the tables of interrupt reset vectors and vector call instructions toward the highest address within the program area. The memory space of the MB89160L series is structured as illustrated below.

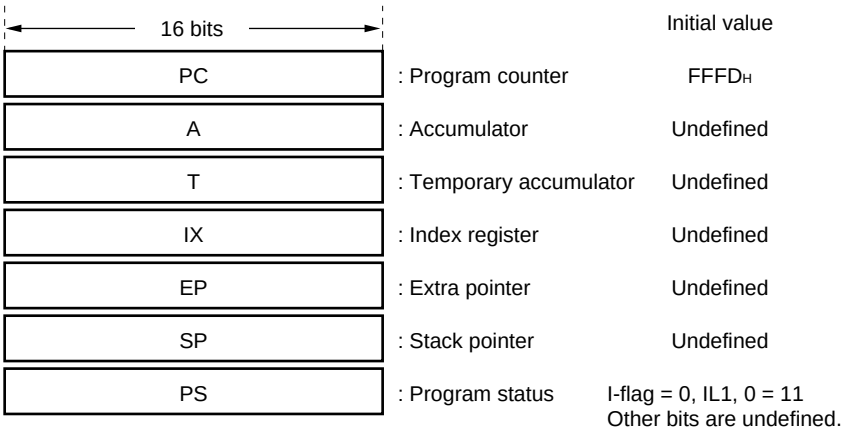
Memory Space



2. Registers

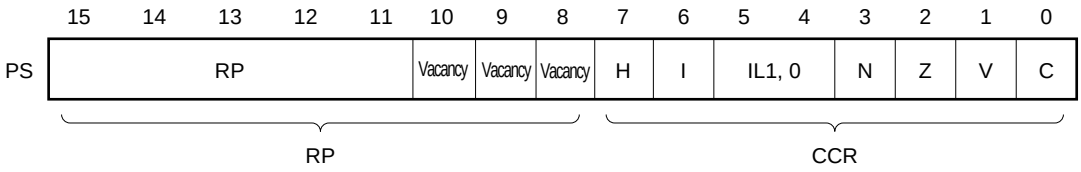
The F²MC-8L family has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The following dedicated registers are provided:

Program counter (PC):	A 16-bit register for indicating instruction storage positions
Accumulator (A):	A 16-bit temporary register for storing arithmetic operations, etc. When the instruction is an 8-bit data processing instruction, the lower byte is used.
Temporary accumulator (T):	A 16-bit register which performs arithmetic operations with the accumulator When the instruction is an 18-bit data processing instruction, the lower byte is used.
Index register (IX):	A 16-bit register for index modification
Extra pointer (EP):	A 16-bit pointer for indicating a memory address
Stack pointer (SP):	A 16-bit register for indicating a stack area
Program status (PS):	A 16-bit register for storing a register pointer, a condition code



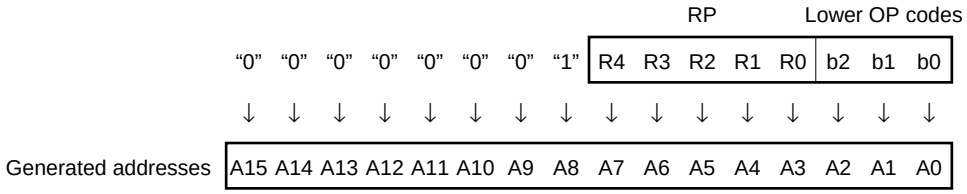
The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and the lower 8 bits for use as a condition code register (CCR). (See the diagram below.)

Structure of the Program Status Register



The RP indicates the address of the register bank currently in use. The relationship between the pointer contents and the actual address is based on the conversion rule illustrated below.

Rule for Conversion of Actual Addresses of the General-purpose Register Area



The CCR consists of bits indicating the results of arithmetic operations and the contents of transfer data and bits for control of CPU operations at the time of an interrupt.

H-flag: Set when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared otherwise. This flag is for decimal adjustment instructions.

I-flag: Interrupt is allowed when this flag is set to 1. Interrupt is prohibited when the flag is set to 0. Set to 0 when reset.

IL1, 0: Indicates the level of the interrupt currently allowed. Processes an interrupt only if its request level is higher than the value indicated by this bit.

IL1	IL0	Interrupt level	High-low
0	0	1	High
0	1		
1	0	2	
1	1	3	Low = no interrupt

N-flag: Set if the MSB is set to 1 as the result of an arithmetic operation. Cleared when the bit is set to 0.

Z-flag: Set when an arithmetic operation results in 0. Cleared otherwise.

V-flag: Set if the complement on 2 overflows as a result of an arithmetic operation. Reset if the overflow does not occur.

C-flag: Set when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared otherwise. Set the shift-out value in the case of a shift instruction.

The following general-purpose registers are provided:

General-purpose registers: An 8-bit register for storing data

The general-purpose registers are 8 bits and located in the register banks of the memory. One bank contains eight registers. Up to a total of 16 banks can be used on the MB89163L (RAM 256 × 8 bits), and a total of 32 banks can be used on the MB89165L, MB89P165/W165, MB89PV160 (RAM 512 × 8 bits). The bank currently in use is indicated by the register bank pointer (RP).

Note : The number of register banks that can be used varies with the RAM size.

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

(AV_{SS} = V_{SS} = 0.0 V)

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage	V_{CC}, AV_{CC}, AVR	V_{SS} – 0.3	V_{SS} + 4.0	V	For MB89163L/165L AV_{CC} must not exceed V_{CC} + 0.3 V. AVR must not exceed AV_{CC} + 0.3 V.
		V_{SS} – 0.3	V_{SS} + 7.0	V	For MB89PV160/P165/W165 AV_{CC} must not exceed V_{CC} + 0.3 V. AVR must not exceed AV_{CC} + 0.3 V.
LCD power supply voltage	V0 to V3	V_{SS} – 0.3	V_{SS} + 4.0	V	For MB89163L/165L V0 to V3 must not exceed V_{CC}.
		V_{SS} – 0.3	V_{SS} + 7.0	V	For MB89PV160/P165/W165 V0 to V3 must not exceed V_{CC}.
Input voltage	V_{I1}	V_{SS} – 0.3	V_{CC} + 0.3	V	V_{I1} must not exceed V_{SS} + 4.0 V for MB89163L/165L and V_{SS} + 7.0 V for MB89PV160/P165/W165. All pins except P20 to P27 without a pull-up resistor.
	V_{I2}	V_{SS} – 0.3	V_{CC} + 4.0	V	P20 to P27 without a pull-up resistor for MB89163L/165L

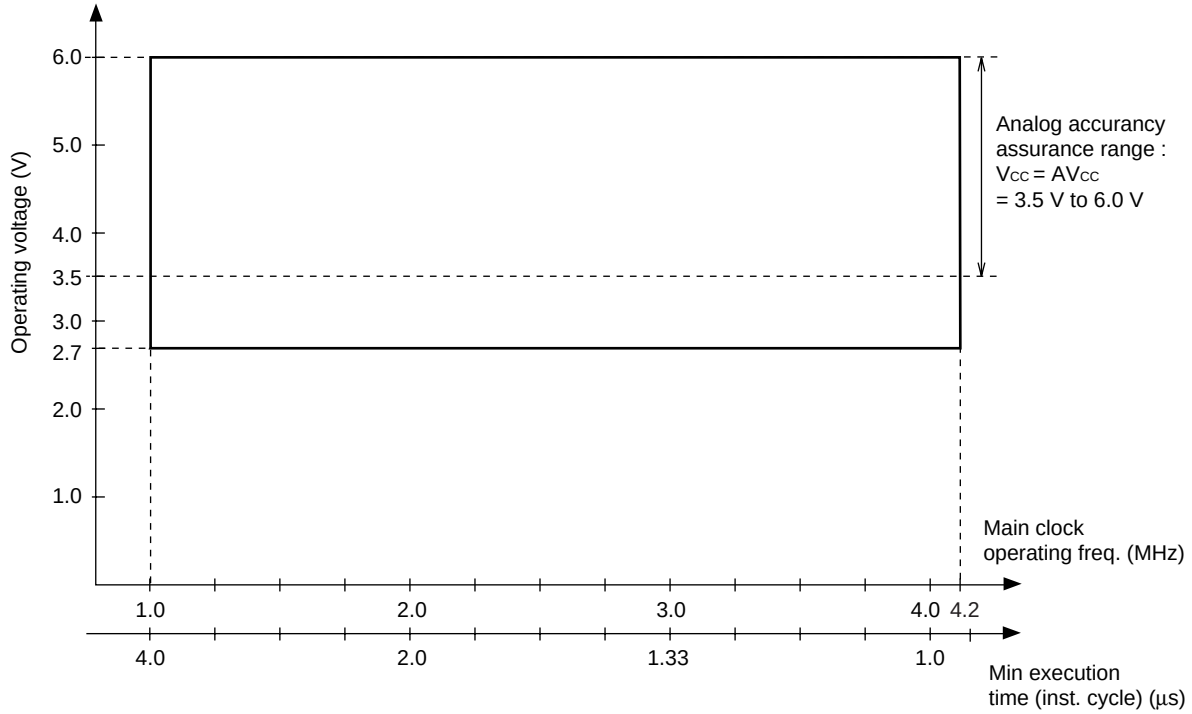
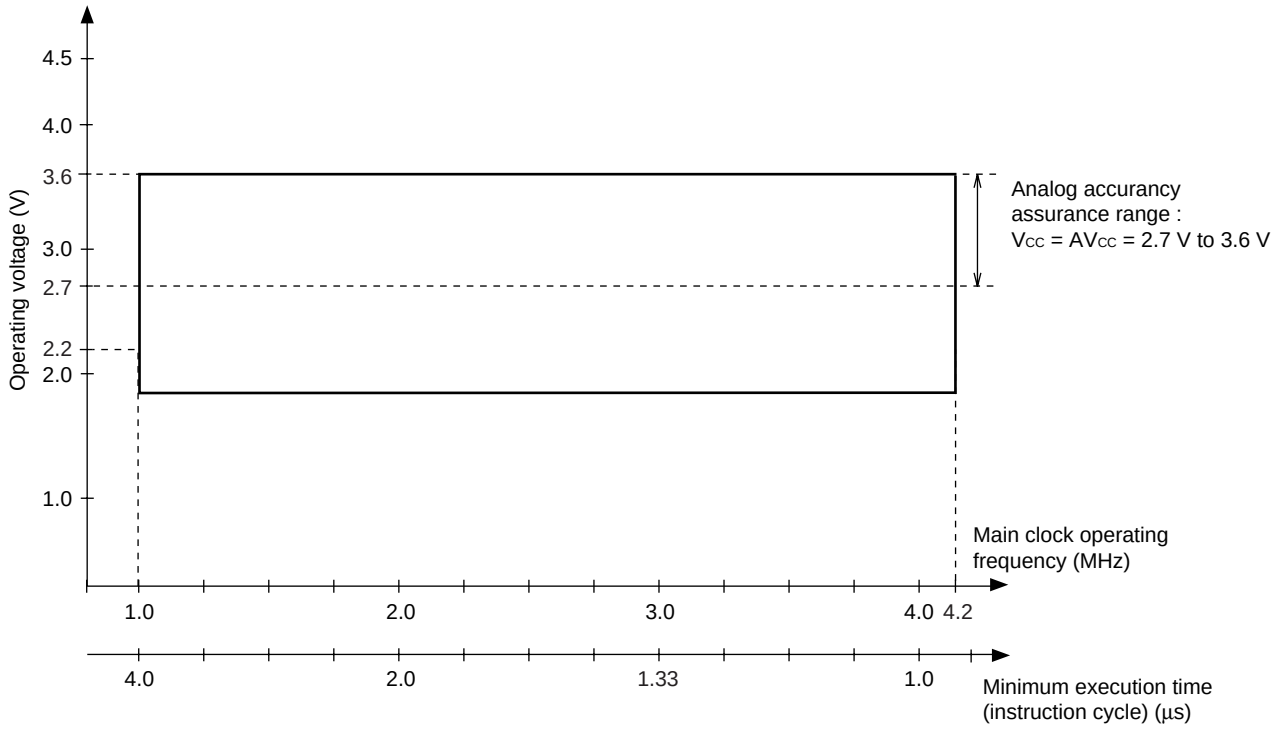
EPROM program power supply voltage	V_{PP}	—	V_{SS} + 13.0	V	MOD1 pin of the MB89P165/W165
Operating temperature	Ta	–40	+85	°C	

* : The minimum operating power supply voltage varies with the execution time (instruction cycle time) setting for the operating frequency.
A/D converter assurance accuracy varies with the operating power supply voltage.

Operating Voltage vs. Main Clock Operating Frequency (MB89PV160/P165/W165)



Operating Voltage vs. Main Clock Operating Frequency (MB89163L/165L)



"Operating Voltage vs. Main Clock Operating Frequency (MB89PV160/P165/W165) and (MB89163L/165L) " indicate the operating frequency of the external oscillator at an instruction cycle of 4/F_{CH}.

Since the operating voltage range is dependent on the instruction cycle, see minimum execution time if the operating speed is switched using a gear.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

4. AC Characteristics

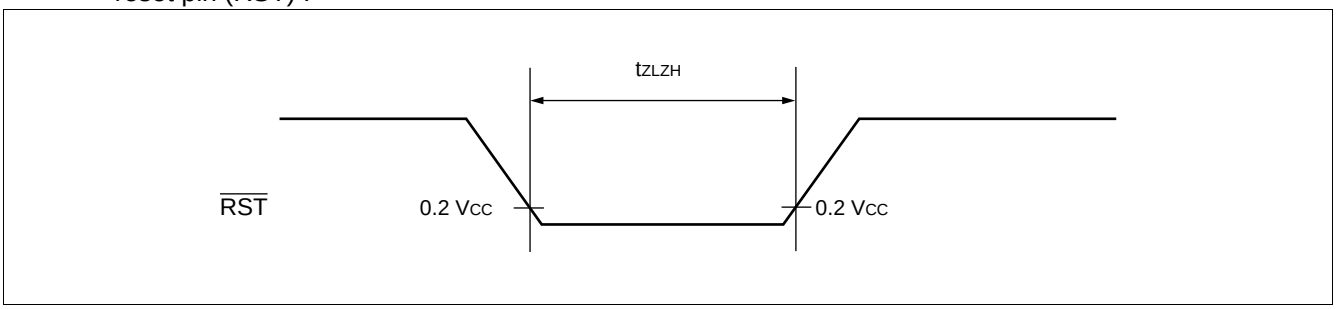
(1) Reset Timing

(V_{CC} = +3.0 V±10% for MB89163L/165L; +5.0 V±10% for MB89PV160/P165/W165, V_{SS} = 0.0 V, Ta = –40°C to +85°C)

Parameter	Symbol	Condition	Value		Unit	Remarks
			Min	Max		
$\overline{RST}$ "L" pulse width	t_{ZLZH}	—	48 t_{HCYL}	—	ns	

Notes : • t_{HCYL} is the main clock oscillator period.

• If the reset pulse applied to the external reset pin ($\overline{RST}$) does not meet the specifications, it may cause malfunctions. Use caution so that the reset pulse less than the specifications will not be fed to the external reset pin ($\overline{RST}$) .



(2) Power-on Reset

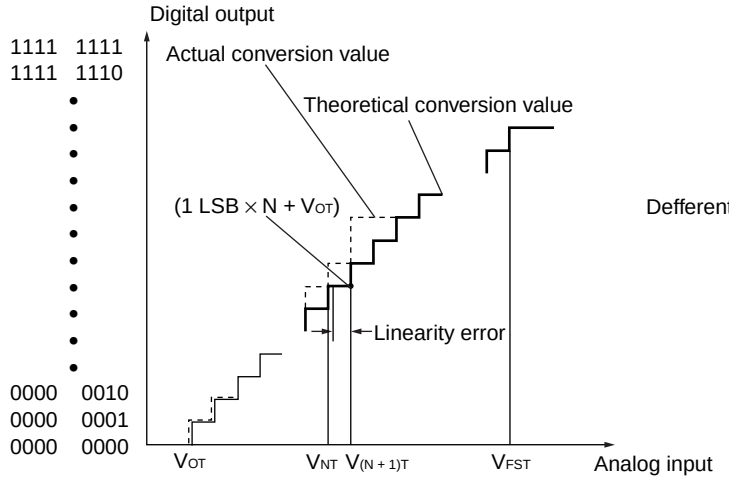
(1) A/D Glossary

- Resolution
  Analog changes that are identifiable with the A/D converter.
  When the number of bits is 8, analog voltage can be divided into 2^8=256.
- Linearity error (unit: LSB)
  The deviation of the straight line connecting the zero transition point (“0000 0000” ↔ “0000 0001”) with the full-scale transition point (“1111 1111” ↔ “1111 1110”) from actual conversion characteristics
- Differential linearity error (unit: LSB)
  The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value
- Total error (unit: LSB)
  The difference between theoretical and actual conversion values



$$1\ \text{LSB} = \frac{\text{AVR}}{256}$$

$$\text{Linearity error} = \frac{V_{NT} - (1\ \text{LSB} \times N + V_{OT})}{1\ \text{LSB}}$$

$$\text{Defferential linearity error} = \frac{V_{(N+1)T} - V_{NT}}{1\ \text{LSB}} - 1$$

$$\text{Total error} = \frac{V_{NT} - (1\ \text{LSB} \times N + 1\ \text{LSB})}{1\ \text{LSB}}$$

(2) Precautions

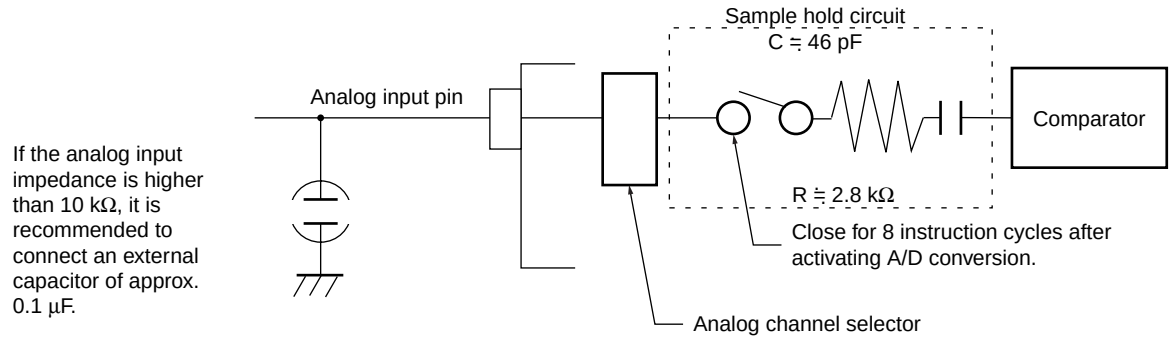
- **Input impedance of analog input pins**

  The A/D converter contains a sample hold circuit as illustrated below to fetch analog input voltage into the sample hold capacitor for eight instruction cycles after activating A/D conversion.

  For this reason, if the output impedance of the external circuit for the analog input is high, analog input voltage might not stabilize within the analog input sampling period. Therefore, it is recommended to keep the output impedance of the external circuit low (below 10 kΩ).

  Note that if the impedance cannot be kept low, it is recommended to connect an external capacitor of about 0.1 μF for the analog input pin.

Analog Input Equivalent Circuit



- **Error**

  The smaller the |AVR – AV_{SS}| is, the greater the error would become relatively.
