## FUNCTIONAL DESCRIPTION

### I<sup>2</sup>C Interface

This is a slave mode I<sup>2</sup>C interface which address is \$7AH.

There are three data transmission formats for writing: Format (a), (b) and (c).

Format (a):

S	0	1	1	1	0	1	0	A	ROW	A	COL	A	Data	A	ROW	A	COL	A	Data	A	.....	P
---	---	---	---	---	---	---	---	---	-----	---	-----	---	------	---	-----	---	-----	---	------	---	-------	---

Format (b):

S	0	1	1	1	0	1	0	A	ROW	A	COL	A	Data	A	COL	A	Data	A	COL	A	.....	P
---	---	---	---	---	---	---	---	---	-----	---	-----	---	------	---	-----	---	------	---	-----	---	-------	---

Format (c):

S	0	1	1	1	0	1	0	A	ROW	A	COL	A	Data	A	Data	A	Data	A	Data	A	.....	P
---	---	---	---	---	---	---	---	---	-----	---	-----	---	------	---	------	---	------	---	------	---	-------	---

Where S = START condition

R/W = Read/Write control bit. "1" means READ operation and "0" means WRITE operation.

A = Acknowledge bit. "0" means acknowledge.

P = STOP condition

ROW = Row address byte

COL = Column address byte

Data = Data byte

Format (a) is used when write data in different row and column address.

Format (b) is used when write data in the same row.

Format (c) is suitable for writing data sequentially. The column address will increase automatically.

Format (a) (b), Format (a) (c), Format (b) (a) or Format (b) (c) is allowed. But Format (c) (a) and Format (c) (b) is not allowed.

### Transmission Format

	Address	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Format
Address Bytes Control Bytes	Row	1	0	0	D	D	D	D	D	a,b,c
	Column <sub>a,b</sub>	0	0	x	D	D	D	D	D	a,b

### Display RAM and Row Control Register

#### DISPLAY RAM

The display RAM stores the data to be displayed. Address byte determines display character and attribute bytes determines character background, character color and blinking effect.

The memory location is shown as below.

CA7~CA0 – Address of Character ROM

**Attribute Byte**
