查询UPD80C35C供应商

NEC Electronics Inc.

捷多邦, 专业IC设计公司 PD80C35/C48, μ PD48 8-BIT, SINGLE-CHIP CMOS MICROCOMPUTERS

Description

The μ PD80C35, μ PD80C48, and μ PD48 are true stand-alone 8-bit microcomputers fabricated using CMOS technology. All of the functional blocks necessary for an integrated microcomputer are incorporated, including a 1K-byte ROM (μ PD80C48 only), a 64-byte RAM, 27 I/O lines, an 8-bit timer/event counter, and a clock generator. This integrated capability permits use in stand-alone applications. For designs requiring extra capability, the μ PD80C35/ μ PD80C48 can be expanded using peripherals and is memory compatible with industry-standard 8080A/8085A processors.

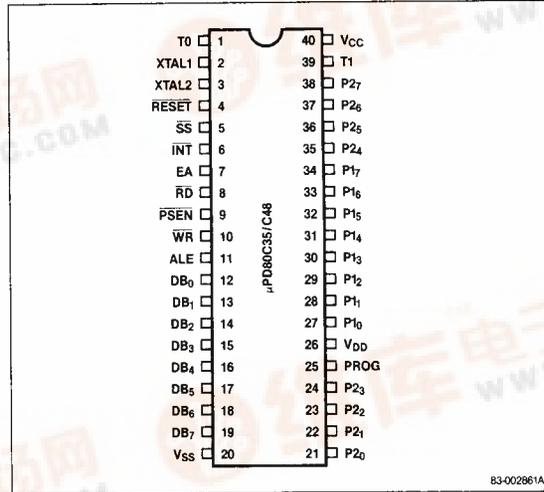

Providing compatibility with industry-standard 8048, 8748, and 8035 processors, the μ PD80C35/ μ PD80C48 features significant savings in power consumption. In addition to the power savings gained through CMOS technology, the μ PD80C35/ μ PD80C48 offers two standby modes (Halt and Stop modes) to further minimize power drain.

Features

- 8-Bit CPU with memory and I/O on a single-chip
- Hardware/software-compatible with industry-standard 8048, 8748, and 8035 processors
- 1K x 8 ROM (μ PD80C48 only)
- 64 x 8 RAM
- 27 I/O lines
- 2.5- μ s cycle time (6-MHz crystal)
- All instructions executable in 1 or 2 cycles
- 97 instructions: 70 percent are single-byte instructions
- Internal timer/event counter
- Two interrupts (external and timer)
- Easily expandable memory and I/O
- Bus compatible with 8080A/8085A peripherals
- Power-efficient CMOS technology requiring a single +2.5 to +6.0 V power supply
- Halt mode
- Stop mode

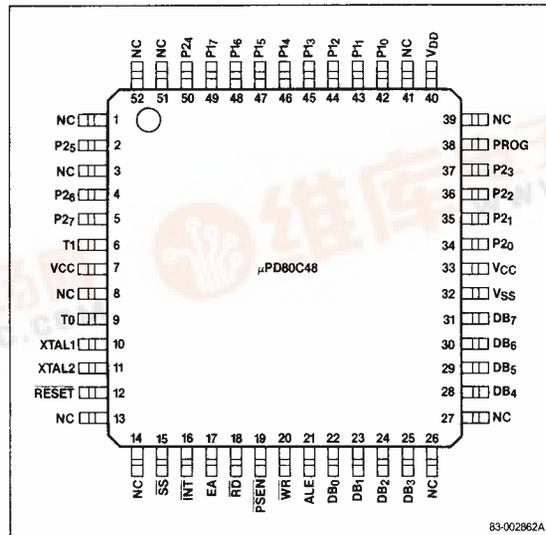

Pin Configurations

Pin Configurations (cont)

44-Pin Plastic Miniflat

Ordering Information

Part Number	Package Type	Max Frequency of Operation	ROM
μPD80C35C	40-pin plastic DIP	6 MHz	None
μPD80C48C	40-pin plastic DIP	6 MHz	1K x 8
μPD80C48G-00	52-pin plastic miniflat	6 MHz	1K x 8
μPD48G-22	44-pin plastic miniflat	6 MHz	1K x 8

Note:

μPD80C48C, μPD80C48G-00, and μPD48G-22 have two optional port types: type 0, I_{OH} = -5 μA; type 1, I_{OH} = -50 μA. Type 0 or 1 can be selected independently for P1₀-P1₇, P2₀-P2₃, and P2₄-P2₇.

Pin Identification

Symbol	Function
T0	Test 0 input/clock output
XTAL1	Crystal 1 input
XTAL2	Crystal 2 input
RESET	Reset input
SS	Software stop input
INT	Interrupt input
EA	External access input
RD	Read output
PSEN	Program store enable output
WR	Write output
ALE	Address latch enable output
DB ₀ -DB ₇	Bidirectional data bus
V _{SS}	Ground
P2 ₀ -P2 ₇	Quasi-bidirectional port 2
PROG	Program output
V _{DD}	Oscillator control voltage
P1 ₀ -P1 ₇	Quasi-bidirectional port 1
T1	Test 1 input
V _{CC}	Primary power supply
NC	No connection

Pin Functions

XTAL1, XTAL2 [Crystals 1, 2]

XTAL1 and XTAL2 are the crystal inputs for the internal clock oscillator. XTAL1 is also used as an input for external clock signals.

T0 [Test 0]

The JT0 and JNT0 instructions test the level of T0 and, if it is high, the program address jumps to the specified address. T0 becomes a clock output when the ENT0 CLK instruction is executed.

T1 [Test 1]

The JT1 and JNT1 instructions test the level of T1 and, if it is high, the program address jumps to the specified address. T1 becomes an internal counter input when the STRT CNT instruction is executed.

RESET [Reset]

RESET initializes the processor and is also used to verify the internal ROM. RESET determines the oscillation stabilizing time during the release of STOP mode. The RESET pulse width requires at least 5 machine cycles when the supply voltage is within specifications at the oscillation frequency in stable

\overline{SS} [Single Step]

\overline{SS} causes the processor to execute the program one step at a time.

\overline{INT} [Interrupt]

\overline{INT} starts an interrupt if interrupts are enabled. A reset disables an interrupt. \overline{INT} can be tested with the JN1 instruction and, depending on the results, a jump to the specified address can occur.

EA [External Access]

EA disables internal program memory and fetches and accesses external program memory. EA is used for system testing and debugging.

\overline{RD} [Read]

\overline{RD} enables a data read from external memory.

\overline{WR} [Write]

\overline{WR} enables a data write to external memory.

\overline{PSEN} [Program Store Enable]

\overline{PSEN} fetches instructions only from external program memory.

ALE [Address Latch Enable]

ALE occurs at each cycle. The falling edge of ALE addresses external data memory or external program memory. ALE can also be used as a clock output.

DB₀-DB₇ [Data Bus]

DB₀-DB₇ is a bidirectional port, which reads and writes data using \overline{RD} and \overline{WR} for latching. During an external program memory fetch, DB₀-DB₇ output the low-order eight bits of the memory address. \overline{PSEN} fetches the instruction. DB₀-DB₇ also output the address of an external data memory fetch. The addressed data is read and written by \overline{RD} and \overline{WR} .

P₁₀-P₁₇ [Port 1]

P₁₀-P₁₇ is an 8-bit quasi-bidirectional port.

P₂₀-P₂₇ [Port 2]

P₂₀-P₂₇ is an 8-bit quasi-bidirectional port. P₂₀-P₂₃ output the high-order four bits of the address during an external program memory fetch. P₂₀-P₂₃ also function as a 4-bit I/O bus for the μ PD82C43 I/O port expander.

PROG [Program Pulse]

PROG is used as an output pulse during a fetch when interfacing with the μ PD82C43 I/O port expander.

V_{DD} [Oscillator Control Voltage]

V_{DD} stops and starts the oscillator in STOP mode. STOP mode is enabled by forcing V_{DD} low during a rest.

V_{CC} [Primary Power Supply]

V_{CC} is the primary power supply. V_{CC} must be between +2.5 V and +6.0 V for normal operation. In STOP mode, V_{CC} must be at least +2.0 V to ensure data retention.

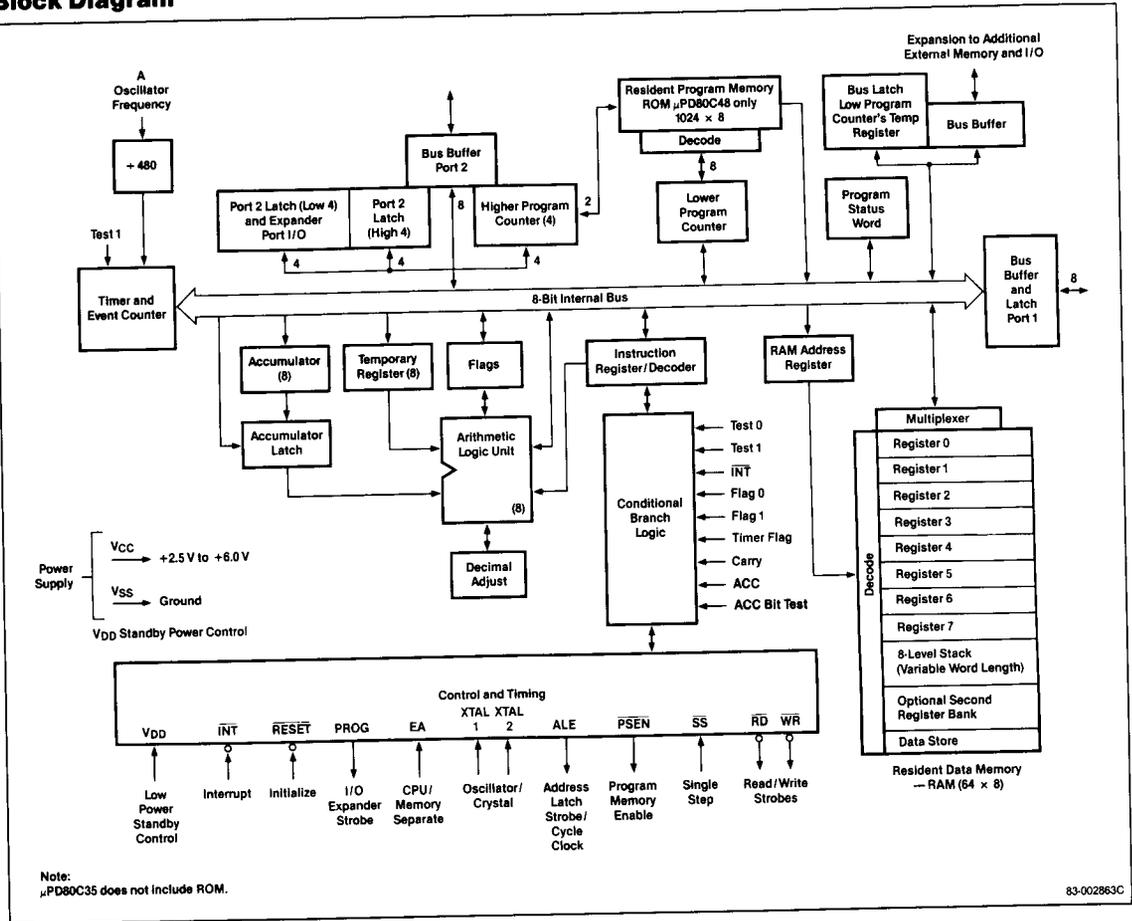

V_{SS} [Ground]

V_{SS} is ground potential.

NC [No Connection]

NC is no connection.

Block Diagram

Absolute Maximum Ratings

T_A = 25°C

Power supply voltage, V _{CC}	V _{SS} - 0.3 to +10 V
Input voltage, V _{IN}	V _{SS} - 0.3 to V _{CC} + 0.3 V
Output voltage, V _O	V _{SS} - 0.3 to V _{CC} + 0.3 V
Operating temperature, T _{OP}	-40°C to +85°C
Storage temperature, T _{STG}	-65°C to +150°C

Comment: Exposing the device to stresses above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational sections of the specification. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Characteristics

Standard Voltage Range

$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, $V_{CC} = +5\text{V} \pm 10\%$, $V_{SS} = 0\text{V}$

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
Input voltage low	V_{IL}	-0.3		+0.8	V	
Input voltage high	V_{IH}	$V_{CC}-2$		V_{CC}	V	Except XTAL1, XTAL2, RESET
	V_{IH1}	$V_{CC}-1$		V_{CC}	V	RESET, XTAL1, XTAL2
Output voltage low	V_{OL}			+0.45	V	$I_{OL} = 2.0\text{mA}$
Output voltage high	V_{OH}	2.4			V	Bus, RD, WR, PSEN, ALE, PROG, T0; $I_{OH} = -100\mu\text{A}$
	$V_{OH1(1)}$	2.4			V	$I_{OH} = -5\mu\text{A}$ (type 0) port 1, port 2
		2.4			V	$I_{OH} = -50\mu\text{A}$ (type 1) port 1, port 2
	V_{OH2}	$V_{CC}-0.5$			V	All outputs, $I_{OH} = -0.2\text{mA}$
Input current	$I_{ILP(1)}$	-15	-40		μA	Port 1, port 2; $V_{IN} \leq V_{IL}$ (type 0)
			-500		μA	Port 1, port 2; $V_{IN} \leq V_{IL}$ (type 1)
	I_{ILC}		-40		μA	SS, RESET; $V_{IN} \leq V_{IL}$
Input leakage current	I_{L11}		± 1		μA	T1, INT, V_{CC} ; $V_{SS} \leq V_{IN} \leq V_{CC}$
	I_{L12}		± 3		μA	EA; $V_{SS} \leq V_{IN} \leq V_{CC}$
Output leakage current	I_{LO}		± 1		μA	$V_{SS} \leq V_O \leq V_{CC}$ High impedance, bus, T0
Standby current	I_{CC1}	0.4	0.8		mA	Halt mode $t_{CY} = 2.5\mu\text{s}$
	I_{CC2}	1	20		μA	Stop mode (Note 2)
Supply current	I_{CC}	4	8		mA	$t_{CY} = 2.5\mu\text{s}$
Data retention voltage	V_{CCDR}	2.0			V	Stop mode (V_{DD} , RESET $\leq 0.4\text{V}$)
		1	50	μA	$V_{CC} = 6\text{V}$	

Extended Voltage Range

$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, $V_{CC} = +2.5\text{V}$ to $+6.0\text{V}$, $V_{SS} = 0\text{V}$

Parameter	Symbol	Limits			Unit	Test Conditions
		Min	Typ	Max		
Input voltage low	V_{IL}	-0.3		$+0.18V_{CC}$	V	
Input voltage high	V_{IH}	$0.7V_{CC}$		V_{CC}	V	Except XTAL1, XTAL2
	V_{IH1}	$0.8V_{CC}$		V_{CC}	V	XTAL1, XTAL2
Output voltage low	V_{OL}			+0.45	V	$I_{OL} = 1.0\text{mA}$
Output voltage high	V_{OH}	$0.75V_{CC}$			V	Bus, RD, WR, PSEN, ALE, PROG, T0; $I_{OH} = -100\mu\text{A}$
	V_{OH1}	$0.7V_{CC}$			V	All other outputs; $I_{OH} = -1\mu\text{A}$ (type 0) port 1, port 2
		$0.7V_{CC}$			V	All other outputs; $I_{OH} = -10\mu\text{A}$ (type 1) port 1, port 2
Input current	I_{ILP}	-15	-40		μA	Port 1, port 2; $V_{IN} \leq V_{IL}$ (type 0)
			-500		μA	Port 1, port 2; $V_{IN} \leq V_{IL}$ (type 1)
Input leakage current	I_{IL}		-40		μA	SS, RESET; $V_{IN} \leq V_{IL}$
	I_{L11}		± 1		μA	T1, INT, $V_{SS} < V_{IN} < V_{CC}$
	I_{L12}		± 5		μA	EA; $V_{SS} < V_{IN} < V_{CC}$
Output leakage current	I_{LO}		± 1		μA	$V_{SS} < V_O < V_{CC}$, Bus, T0 — high impedance state
Supply current	I_{CC}	0.8	1.6		mA	$V_{CC} = 3\text{V}$, $t_{CY} = 10\mu\text{s}$
		6	12		μA	$V_{CC} = 6\text{V}$, $t_{CY} = 25\mu\text{s}$
Standby current	I_{CC1}	100	200		μA	Halt mode; $V_{CC} = 3\text{V}$, $t_{CY} = 10\mu\text{s}$
				0.6	1.2	mA
	I_{CC2}	1	20		μA	Stop mode, $V_{CC} = 3\text{V}$
		1	50		μA	$V_{CC} = 6\text{V}$

Note:

(1) Types 0, 1 for μPD80C48 only.
Type 0 for μPD80C35 only.

(2) Input pin voltage is $V_{IN} \leq V_{IL}$, or $V_{IN} \geq V_{IH}$.

AC Characteristics

Read, Write and Instruction Fetch: External Data and Program Memory

$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, $V_{CC} = V_{DD} = +5\text{V} \pm 10\%$; $V_{SS} = 0\text{V}$

Parameter	Symbol	Limits				Unit	Test Conditions
		$V_{CC} = +5\text{V} \pm 10\%$		$V_{CC} = 2.5\text{V to }6.0\text{V}$			
		Min	Max	Min	Max

Low Power Standby Operation

1) Halt Mode (When EI)

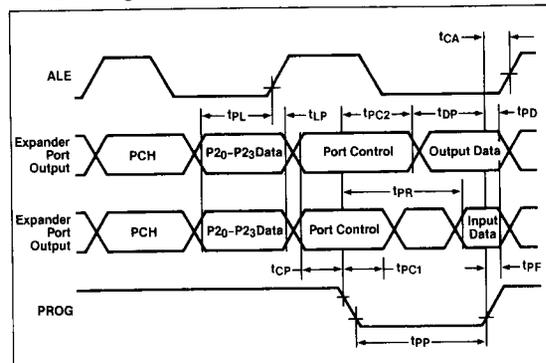

2) Stop Mode

4

Port 2 Timing

Functional Description

Standby Function

Halt Mode

In Halt mode, the oscillator continues to operate, but the internal clock is disabled. The status of all internal logic just prior to execution of the HALT instruction is maintained by the CPU. In Halt mode, power consumption is less than 10 percent of normal μPD80C48 operation and less than 1 percent of normal 8048 operation.

The Halt mode is initiated by execution of the HALT instruction, and is released by either INT or RESET input.

INT Input. When the INT pin receives a low-level input, if interrupts are enabled, the internal clock is restarted and the interrupt is executed after the first or second instruction following the HALT instruction. However, if interrupts are disabled, program operation is resumed from the next address following the HALT instruction. The first instruction following a HALT instruction should be a NOP instruction to ensure proper program execution.

If the Halt mode is released when interrupts are enabled, the interrupt service routine is usually executed after the first or second instruction following the release of Halt mode. However, if either a timer or external interrupt is accepted within one machine cycle prior to a HALT instruction, the corresponding timer or external interrupt service routine is executed immediately following the release of Halt mode. It is important to note this sequence of execution when considering interrupt service routine execution following a HALT instruction.

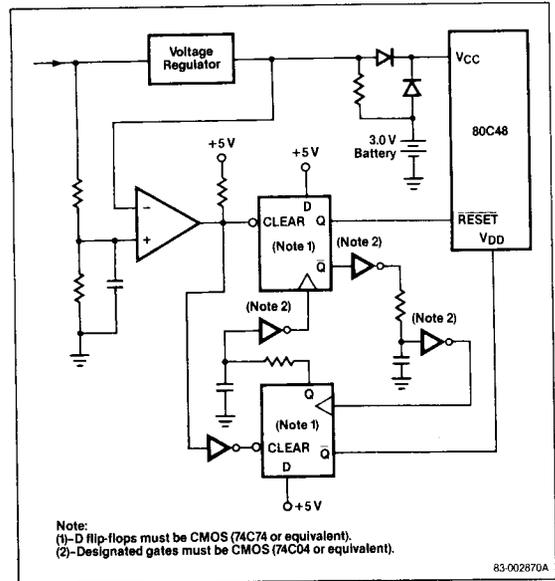

RESET Input. When a low-level input is received by the RESET pin, Halt mode is released and the normal reset operation is activated, restarting program operation from address 0.

Stop Mode

In Stop mode, the oscillator is deactivated and only the contents of RAM are maintained. The operation status of the μPD80C35/μPD80C48 resembles that of a reset condition. Because only the contents of RAM are maintained, Stop mode provides even lower power consumption than Halt mode, only requiring a minimum V_{CC} as low as +2 V.

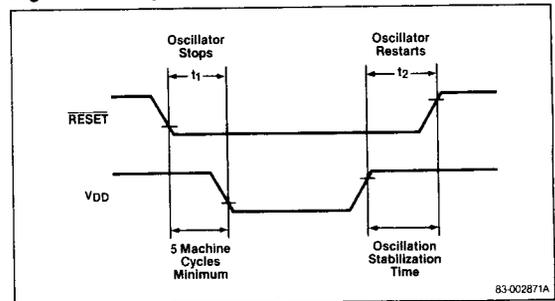

Stop mode is initiated by setting V_{DD} to low when RESET is low, to protect the contents of RAM. Stop mode is released by first raising the supply voltage at the V_{CC} pin from standby level to correct operating level and setting V_{DD} to high when RESET is low. After the oscillator has been restarted and the oscillation has stabilized, RESET must be set to high, whereby program operation is started from address 0. Figure 1 shows the Stop mode circuit.

Figure 1. Stop Mode Circuit

Stop Mode Circuit. Since V_{DD} controls the restarting of the oscillator, it is important that V_{DD} be protected from noise interference. The time required to reset the CPU is represented by t₁ (see figure 2), which is a minimum of 5 machine cycles. The reset operation will not be completed in less than 5 machine cycles. In Stop mode, it is important to note that if V_{DD} goes low before 5 machine cycles have elapsed, the CPU will be deactivated and the output of ALE, RD, WR, PSEN, and PROG will not have been stabilized.

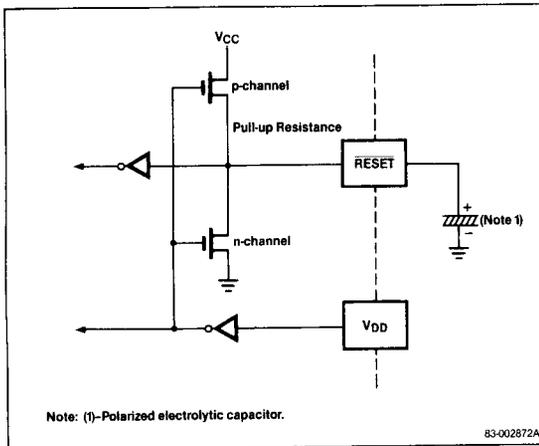

Figure 2. Stop Mode Timing

Oscillation stabilization time is represented by t_2 (see figure 2). When V_{DD} goes high, oscillator operation is reactivated, but it takes time before oscillation can be stabilized. In particular, such high Q resonators as crystals require longer periods to stabilize. Because there is a delay between restarting of the oscillator and oscillator stabilization, t_2 should be long enough to ensure that the oscillator has been fully stabilized.

To facilitate Stop mode control, an external capacitor can be connected to the RESET pin (see figure 3), affecting only t_2 , allowing control of the oscillator stabilization time. When V_{DD} is asserted in Stop mode, the capacitor begins charging, pulling up $\overline{\text{RESET}}$. When $\overline{\text{RESET}}$ reaches a threshold level equivalent to a logic 1, Stop mode is released. The time it takes $\overline{\text{RESET}}$ to reach the threshold level of logic 1 determines the oscillator stabilization time, which is a function of the capacitance and pull-up resistance values.

Figure 3. Stop Mode Control Circuit

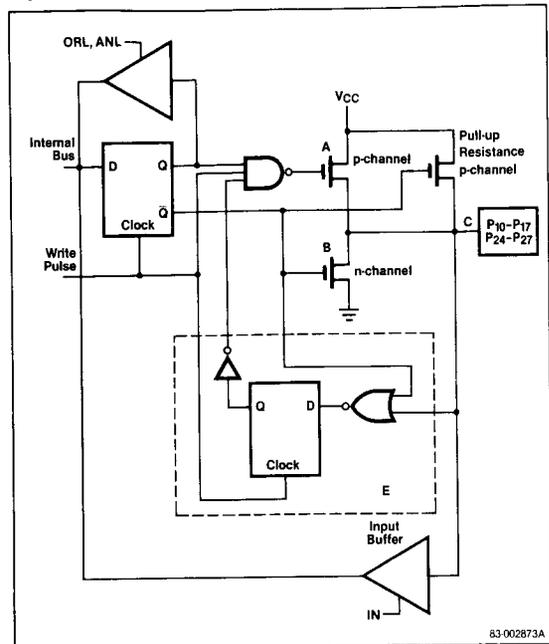

Port Operation

A port-loading option is offered at the time of ordering the mask. Individual source current requirements for Port 1 and the upper and lower halves of Port 2 may be factory set at either $-5\mu\text{A}$ or $-50\mu\text{A}$ (see Port-Loading Options table). The $-50\mu\text{A}$ option is required for interfacing with TTL/NMOS devices. The $-5\mu\text{A}$ option is recommended for interfacing to other CMOS devices. The CMOS option results in lower power consumption and greater noise immunity.

Port lines P10-P17 and P24-P27 include a protective circuit "E" to prevent a signal conflict at the port. The circuit prevents a logic 1 from being written to a line that is being pulled down externally (see figure 4, Port Protection Circuit E diagram). When a logic 0 is detected at the port line and a logic 1 is written from the bus, the NOR gate sends a logic 1 to the D input of the flip-flop. The output is inverted, forcing the NAND gate to send a high-level output. This turns off transistor A, preventing the output of a logic 1 from the port.

Figure 4. Port Protection Circuit E

Port-Loading Options

$I_{OH}(\text{min})$ $V_{CC} = V_{DD} = 5V \pm 10\%$; $V_{OH} = 2.4V(\text{min})$

Option Selected	P1 ₀ -P1 ₇	P2 ₀ -P2 ₃	P2 ₄ -P2 ₇	Unit
A	-5	-5	-5	μA
B	-50	-5	-5	μA
C	-5	-50	-5	μA
D	-50	-50	-5	μA
E	-5	-5	-50	μA
F	-50	-5	-50	μA
G	-5	-50	-50	μA
H	-50	-50	-50	μA

Note:

- (1) The selection of $I_{OH} = -5\mu A$ will result in a port source current of $I_{LP} = -40\mu A$ max when used as input port.
- (2) The selection of $I_{OH} = -50\mu A$ will result in a port source current of $I_{LP} = -500\mu A$ max when used as input port.

Oscillator Operation

The oscillator maintains an internal frequency for clock generation and controls all system timing cycles. The oscillation is initiated by either a self-generating external resonator or external clock input. The oscillator acts as a high-gain amplifier which produces square-wave pulses at the frequency determined by the resonator or clock source to which it is connected.

To obtain the oscillation frequency, an external LC network (figure 5) may be connected to the oscillator, or, a ceramic or crystal external resonator (figure 6) may be connected.

Figure 5. LC Frequency Reference Circuit

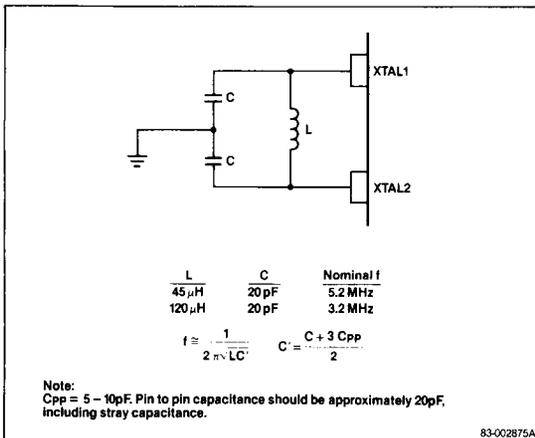

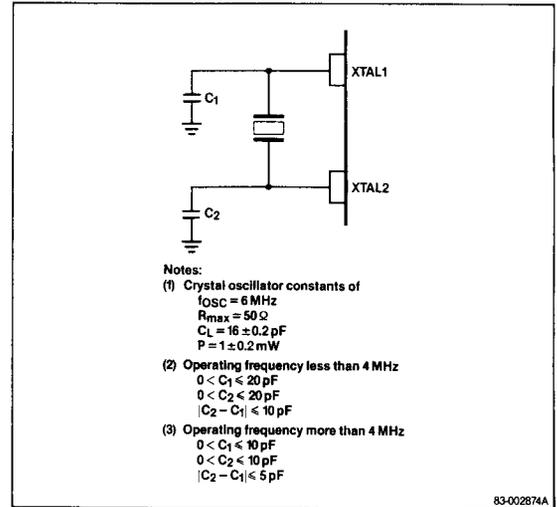

Figure 6. Crystal Frequency Reference Circuit

As the crystal frequency is lowered, there is an equivalent reduction in series resistance (R). As the temperature of the crystal is lowered, R is increased. Due to this relationship, it becomes difficult to stabilize oscillation when there is low power supply voltage. When V_{CC} is less than 2.7 V and the oscillator frequency is 3 MHz or less, T_A (ambient temperature) should not be less than -10°C .

Figures 7 and 8 show the ceramic resonator and external clock frequency reference circuits. Figure 9 shows the μPD80C35/μPD80C48 major I/O signals.

Instruction Set

Instruction Set Symbol Definitions

Symbol	Description
A	Accumulator
AC	Auxiliary carry flag
addr	Program or data memory address (a_0 - a_7) or (a_0 - a_{10})
b	Accumulator bit ($b = 0-7$)
BS	Bank switch
BUS	Bus
C	Carry flag
CLK	Clock
CNT	Counter
data	8-bit binary data (d_0 - d_7)
DBF	Memory bank flip-flop
F0, F1	Flag 0, flag 1
INT	Interrupt pin
n	Indicates the hex number of the specified register or port
PC	Program counter
Pp	Port 1, port 2, or ports 4-7 ($p = 1, 2$ or 4-7)
PSW	Program status word
Rr	Register ($r = 0-7$)

Symbol	Description
SP	Stack pointer
T	Timer
TF	Timer flag
T0, T1	Test 0, test 1 pin
#	Prefix for immediate data
@	Prefix for indirect address
x	Indicates the hex number corresponding to the accumulator bit or page number specified in the operand
(x)	Contents of RAM
((x))	Contents of memory location addressed by (x)
←	Transfer direction, result
AND	Logical product (logical AND)
OR	Logical sum (logical OR)
EXOR	Exclusive-OR
—	Complement

Instruction Set (cont)

Mnemonic	Function	Description	Operation Code															
			Hex Code	D7	D6	D5	D4	D3	D2	D1	D0	Cycles	Bytes					
A, @ Rr r = 0-1	$(A) \leftarrow (A) \text{ OR } ((Rr))$	Takes the logical sum (logical OR) of the contents of the internal data memory location specified by bits 0-5 in register Rr, and the contents of the accumulator, and stores the result in the accumulator.	4n(4)	0	1	0	0	0	0	0	0	0	0	r	r	1	1	
A	$(AN + 1) \leftarrow (AN)$ $(A_0) \leftarrow (A_7) N = 0-6$	Rotates the contents of the accumulator one bit to the left. The MSB is rotated into the LSB.	E7	1	1	1	0	0	1	1	1	1	1	1	1	1	1	
A	$(AN + 1) \leftarrow (AN); N = 0-6$ $(A_0) \leftarrow (C)$ $(C) \leftarrow (A_7)$	Rotates the contents of the accumulator one bit to the left through carry.	F7	1	1	1	1	0	1	1	1	1	1	1	1	1	1	
A	$(AN) \leftarrow (AN + 1); N = 0-6$ $(A_7) \leftarrow (A_0)$	Rotates the contents of the accumulator one bit to the right. The LSB is rotated into the MSB.	77	0	1	1	1	0	1	1	1	1	1	1	1	1	1	
A	$(AN) \leftarrow (AN + 1); N = 0-6$ $(A_7) \leftarrow (C)$ $(C) \leftarrow (A_0)$	Rotates the contents of the accumulator one bit to the right through carry.	67	0	1	1	0	0	1	1	1	1	1	1	1	1	1	
PA	$(A_7-A_7) \leftrightarrow (A_0-A_3)$	Exchanges the contents of the lower 4 bits of the accumulator with the upper 4 bits of the accumulator.	47	0	1	0	0	0	1	1	1	1	1	1	1	1	1	
A, # data	$(A) \leftarrow (A) \text{ XOR data}$	Takes the exclusive OR of immediate data d ₀ -d ₇ and the contents of the accumulator, and stores the result in the accumulator.	D3	1	1	0	1	0	0	1	1	1	1	1	1	2	2	
A, Rr r = 0-7	$(A) \leftarrow (A) \text{ XOR } (Rr)$	Takes the exclusive OR of the contents of register Rr and the accumulator, and stores the result in the accumulator.	Dn(4)	1	1	0	1	1	1	r	r	r	r	r	1	1	1	
A, @ Rr r = 0-1	$(A) \leftarrow (A) \text{ XOR } ((Rr))$	Takes the exclusive OR of the contents of the location in data memory specified by bits 0-5 in register Rr, and the accumulator, and stores the result in the accumulator.	Dn(4)	1	1	0	1	0	0	0	0	0	0	r	r	1	1	
Z Rr, addr	$(Rr) \leftarrow (Rr) - 1; r = 0-7$ If $(Rr) \neq 0$: $(PC_0-PC_7) \leftarrow \text{addr}$	Decrements the contents of register Rr by 1, and if the result is not equal to 0, jumps to the address indicated by a ₀ -a ₇ .	En	1	1	1	0	1	r	r	r	r	r	r	r	2	2	
addr	$(PC_0-PC_7) \leftarrow \text{addr}$ if b = 1 $(PC) = (PC) + 2$ if b = 0	Jumps to the address specified by a ₀ -a ₇ if the bit in the accumulator specified by b ₀ -b ₂ is set.	x2(6)	b ₂	b ₁	b ₀	1	0	0	1	0	1	0	0	0	2	2

Output																
BUS, a	(bus) ← (bus) AND data	Takes the logical AND of the contents of the bus and immediate data d ₀ -d ₇ , and sends the result to the bus.	98	1	0	0	1	1	0	0	0	0	0	0	0	2
Pp, a	(Pp) ← (Pp) AND data; p = 1-2	Takes the logical AND of the contents of designated port Pp and immediate data d ₀ -d ₇ , and sends the result to port Pp for output.	9n(5)	1	0	0	1	1	0	p	p	p	p	p	2	
ID Pp, A	(Pp) ← (Pp) AND (A ₀ -A ₃); p = 4-7	Takes the logical AND of the contents of designated port Pp and the lower 4 bits of the accumulator, and sends the result to port Pp for output.	9n(5)	1	0	0	1	1	1	p	p	p	p	p	2	
Pp	(A) ← (Pp); p = 1-2	Loads the accumulator with the contents of designated port Pp.	0n(5)	0	0	0	0	1	0	p	p	p	p	p	2	
A, BUS	(A) ← (bus)	Loads the contents of the bus into the accumulator on the rising edge of RD.	08	0	0	0	0	1	0	0	0	0	0	0	2	
ID A, Pp	(A ₀ -A ₃) ← (Pp); p = 4-7 (A ₄ -A ₇) ← 0	Moves the contents of designated port Pp to the lower 4 bits of the accumulator, and clears the upper 4 bits.	0n(5)	0	0	0	0	1	1	p	p	p	p	p	2	
ID Pp, A	(Pp) ← (A ₀ -A ₃); p = 4-7	Moves the lower 4 bits of the accumulator to designated port Pp. The upper 4 bits of the accumulator are not changed.	3n(5)	0	0	1	1	1	1	p	p	p	p	p	2	
BUS, a	(bus) ← (bus) OR data	Takes the logical OR of the contents of the bus and immediate data d ₀ -d ₇ , and sends the result to the bus.	88	1	0	0	0	1	0	0	0	0	0	0	2	
ID Pp, A	(Pp) ← (Pp) OR (A ₀ -A ₃); p = 4-7	Takes the logical OR of the contents of designated port Pp and the lower 4 bits of the accumulator, and sends the result to port Pp for output.	8n(5)	1	0	0	0	1	1	p	p	p	p	p	2	
Pp, a	(Pp) ← (Pp) OR data; p = 1-2	Takes the logical OR of the contents of designated port Pp and immediate data d ₀ -d ₇ , and sends the result to port Pp for output.	9n(5)	1	0	0	0	1	0	p	p	p	p	p	2	
L BUS, A	(bus) ← (A)	Latches the contents of the accumulator onto the bus on the rising edge of WR. Note: Never use the OUTL BUS instruction when using external program memory, as this will permanently latch the bus.	02	0	0	0	0	0	0	0	1	0	0	0	2	
L Pp, A	(Pp) ← (A); p = 1-2	Latches the contents of the accumulator into designated port Pp for output.	3n(5)	0	0	1	1	1	0	p	p	p	p	p	2	
isters																
Rr	(Rr) ← (Rr) - 1; r = 0-7	Decrements the contents of register Rr by 1.	Cn(4)	1	1	0	0	1	r	r	r	r	r	r	1	
Rr	(Rr) ← (Rr) + 1; r = 0-7	Increments the contents of register Rr by 1.	1n(4)	0	0	0	1	1	r	r	r	r	r	r	1	
@ Rr	((Rr)) ← ((Rr)) + 1; r = 0-1	Increments by 1 the contents of the data memory location specified by bits 0-5 in register Rr.	1n(4)	0	0	0	1	0	0	0	0	0	0	0	1	

Instruction Set (cont)

Primary operation code designations r and p represent encoded values or the lowest-order bit value of specified registers and ports, respectively. Execution of the ADD, ADDC, and DA instructions affect the carry flags, which are not shown in the respective function equations. These instructions set the carry flags when there is an overflow in the accumulator (the auxiliary carry flag is set when there is an overflow of bit 3 of the accumulator) and clear the carry flags when there is no overflow. Flags that are specifically addressed by flag instructions are shown in the function equations for those instructions.

References to addresses and data are specified in byte 1 and/or 2 in the opcode of the corresponding instruction.

The hex value of n for specific registers is as follows:

a) Direct addressing

R0: n = 8 R2: n = A R4: n = C R6: n = E
R1: n = 9 R3: n = B R5: n = D R7: n = F

b) Indirect addressing

@ R0: n = 0 @ R1: n = 1

The hex value of n for specific ports is as follows:

P1: n = 9 P4: n = C P6: n = E
P2: n = A P5: n = D P7: n = F

The hex value of x for specific accumulator or address bits is as follows:

a) JbB instruction

B₀: x = 1 B₂: x = 5 B₄: x = 9 B₆: x = D
B₁: x = 3 B₃: x = 7 B₅: x = B B₇: x = F

b) JMP instruction

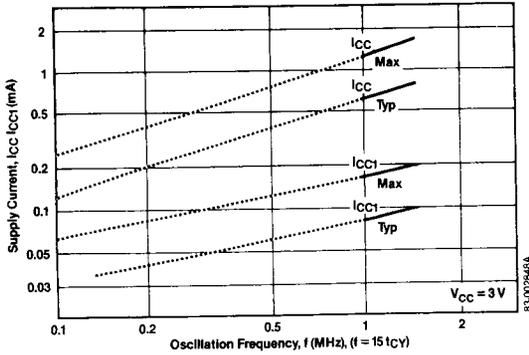

Page 0: x = 0 Page 2: x = 4 Page 4: x = 8 Page 6: x = C
Page 1: x = 2 Page 3: x = 6 Page 5: x = A Page 7: x = E

c) CALL instruction

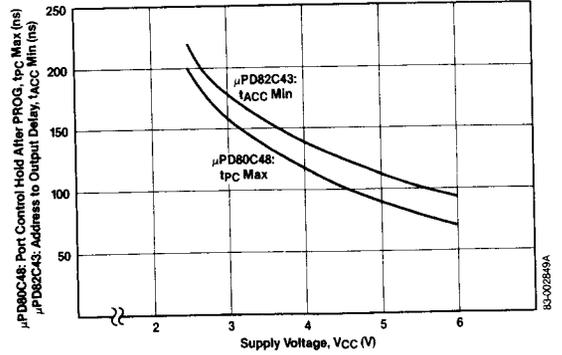

Page 0: x = 1 Page 2: x = 5 Page 4: x = 9 Page 6: x = D
Page 1: x = 3 Page 3: x = 7 Page 5: x = B Page 7: x = F
