

TDA7522

Digital Servo & Decoder

PRODUCT PREVIEW

- BUILT IN 8Bit MICROCONTROLLER (STANDARD ST7) with:
 - 24 KByte ROM available for ST7 & Servo-Audio DSP
 - 1024Byte RAM, including 128byte stack
 - 4KByte RAM for CD-Text memory (for 1block)
 - Built in R-W subcode buffer (Max. 144Byte 8packs) for CD-Text
 - 24 bit general I/O port (PoartA[7-0], PortB[7-0], PortC[7-0])
 - One External Interrupt (16 IRQ encoder inside)
 - 16bit free running counter timer
 - 8bit 1ch general purpose A/D
 - I²C bus I/F
 - Watch dog
 - Kenwood I/F
- STAND-BY MODE (Stop all clocks and Shut down power of Peripheral (PON pin))
- BUILT IN SERVO & AUDIO DIGITAL SIGNAL PROCESSOR (SAC-DSP) inclusive of:
 - 1024x19bit Program RAM
 - 512x16bit Coefficient RAM
 - 1024x20bit Data RAM
 - 128x6bit Decimation RAM
 - MAC: 16 bit (Coefficients) x 20 bit (data) multiplier with 38 bit adder
 - Instruction execution rate as high as 56MIPS
- BUILT IN PROGRAMMABLE CLOCK GENERATOR PLL
- PERIPHERALS for CD PLAYER APPLICATION
 - Data Acquisition, Erasure correction, CLV&CAV controller
 - Subcode decoder (CD-Text, CD-Graphic I/F)
 - Shock proof memory controller, Disturbance detector
 - Decimation filter
- ACTUATORS DRIVING MODE SELECTABLE between PWM or PDM MODE
- 256Fs / 384Fs (16.9344MHz) CLOCK INPUT.

1.0 DESCRIPTION

TDA7522 is a single chip processor consisting of Decoder, Servo and 1bit D/A for 4times CD-ROM / CD-Audio. Main concept of this IC is that it is based on embedded System Micro Controller which allows customer to develop system software very easily: just based on provided commands. Further the microcontroller is fully customer dedicated in terms of both software and general purpose Port.

By combination of ST Analog front-end IC (**TDA7521**), all CD functions including Shock Proof Memory Controller and CD-Text function can be realized.

The TDA7522 portfolio is constituted by three different versions:

- ‘development’: which gives the possibility to have at disposal the complete sw development environment, by means of a dedicated package
- ‘in field development’: standard package but with selection of program memory: on chip RAM, on chip ROM. The program RAM is fully patchable through the standard IIC interface, giving the possibility of sw changing while chip is working in the real environment.
- ‘production’: standard package, but with software permanently stored in the on chip ROM.

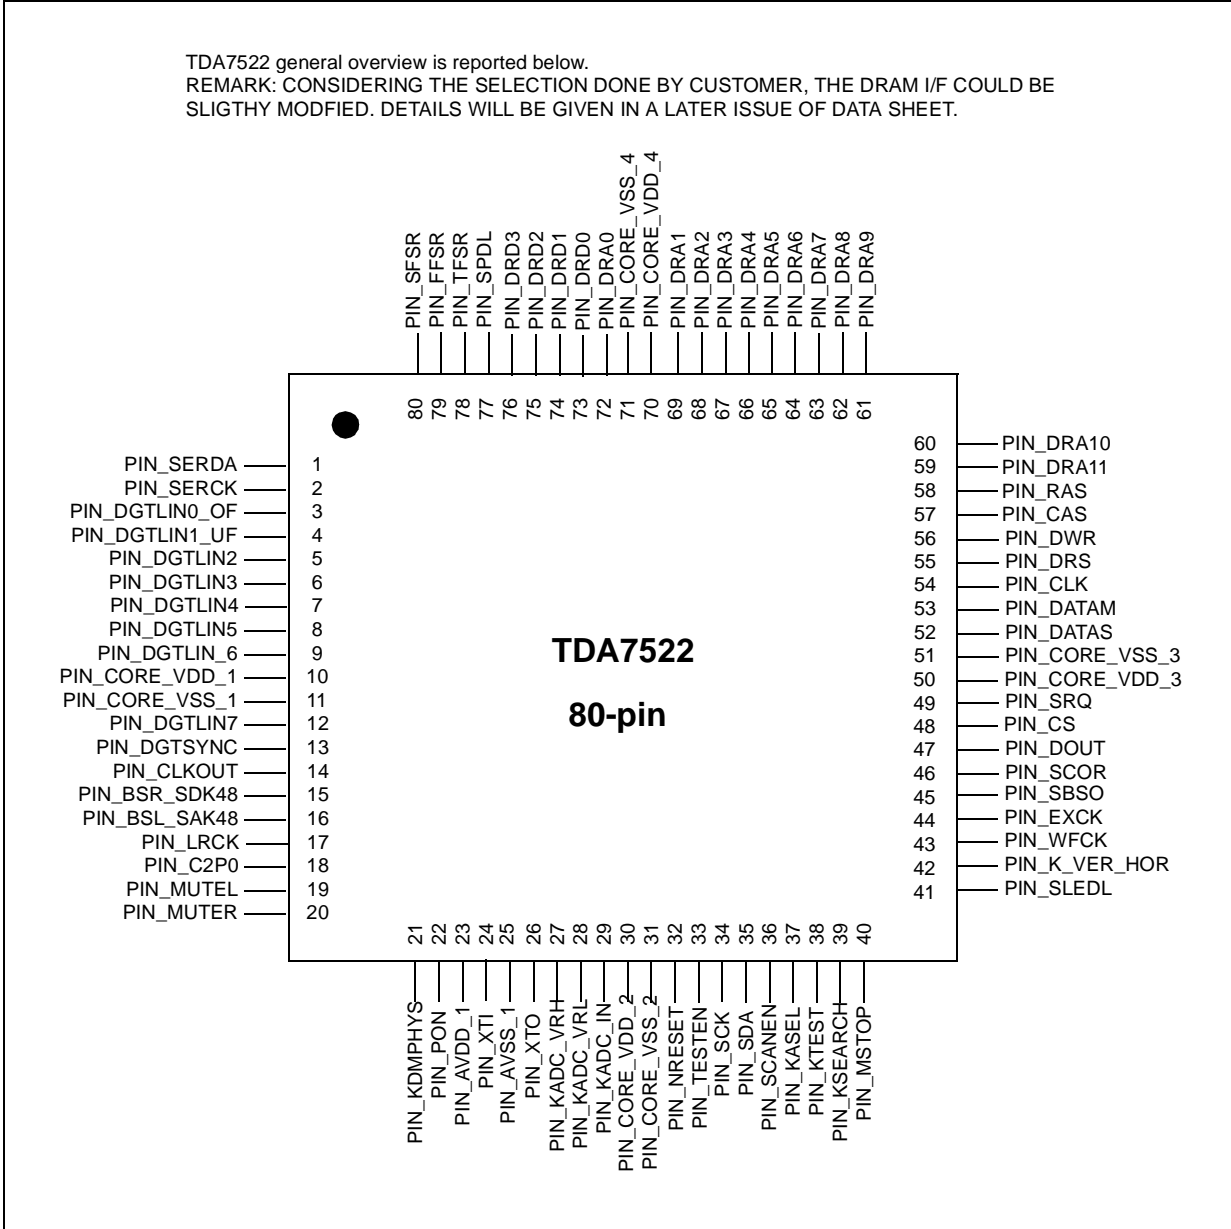

2.0 TECHNOLOGY

All version are produced using the HCMOS6 0.35um technology which works @3.3Vdc; to avoid interface problem with existing logics, all digital Inputs are 5V tolerant. When interfacing logic on TDA7522 outputs, user should take care of output levels that are at CMOS level @3.3V. Depending on output type the I_{OI} and I_{OH} value are guaranteed at 4mA or 8mA; the TDA7522 output driving specification will be included in a next issue of this data sheet.

3.0 ADDITIONAL FEATURES

- 16Mbit DRAM I/F allows maximum 9 seconds shock proof
- Built-in 1bit Delta Sigma modulation for DAC
- Subcode P,Q and R-W decoding
- Error Correction is capable of Dual C1 and quadruple C2 erasure corrections
- Jitter absorbing capability: +/- 6 frames
- Automatic fine gain/balance/offset adjustment for tracking and focus servos
- Built-in Digital Silence detection
- Built-in EFM Demodulation/Sync Rear and Forward protection
- Soft audio mute
- Built-in Digital PLL with large capture range from 0.5 to 4 times speed
- Digital Servo control for all servo loops
- Capable of 2x and 4x speeds for shock proof and CD-ROM applications
- Capable of wide temperature range (-40C to +85C) stable operation
- Fast access times for CD-ROM applications due to wide Capture range and CAV mode run at max 4 times overspeed
- CLV or CAV (lock-to-disk mode) spindle servo operations
- Digital Output SPDIF (DIT CP340)
- Sony LSI Output Interface (for Audio & CD-ROM)
- Pulsate SLED mode support
- Built in 8times Audio Over sampling filter.

Figure 1. Pin Connection

TDA7522

Table 1. Pin Description

Pin Number	Name	Function	Description
01	SERDA	I/O	Data line for Serial I/F
02	SERCK	O	Clock line for Serial I/F
03	DGTLIN0_OF	I	HF bit 0 and Servo overflow
04	DGTLIN1_UF	I	HF bit 1 and Servo underflow
05	DGTLIN2	I	HF bit 2 and Servo bit 0
06	DGTLIN3	I	HF bit 3 and Servo bit 1
07	DGTLIN4	I	HF bit 4 and Servo bit 2
08	DGTLIN5	I	HF bit 5 and Servo bit 3
09	DGTLIN6	I	HF bit 6 and Servo bit 4
10	CORE_VDD_1	Vdd	Digital Power supply
11	CORE_VSS_1	Gnd	Digital Ground
12	DGTLIN7	I	HF bit 7 and Servo bit 5
13	DGTSYNC	I	Sync strobe for Multiplexer
14	CLKOUT	O	System clock output to TDA7521
15	BSR.SDK48	O	LSI I/F clock output or DAC bit stream right channel output
16	BSL.SAK48	O	LSI I/F data output or DAC bit stream left channel output
17	LRCK	O	LSI I/F L/R signal
18	C2PO	O	Validity flag output for CD-ROM decoder
19	MUTEL	O	Mute left signal (active high)
20	MUTER	O	Mute right signal (Active high)
21	KDMPHYS	I/O	De-emphasis indication or ST7 GPIO PA2
22	PON	I/O	System shutdown pin for power saving mode or ST7 GPIO PC7
23	AVDD_1	Vdd	Analog power supply
24	XTI	I	Crystal input
25	AVSS_1	Gnd	Analog ground
26	XTO	O	Crystal output
27	KADC_VRH	I	ADC top reference Voltage input
28	KADC_VRL	I	ADC bottom reference Voltage input
29	KADC_IN	I	ADC input
30	CORE_VDD_2	Vdd	Digital Power supply
31	CORE_VSS_2	Gnd	Digital Ground
32	Nreset	I	Hardware reset

Pin Number	Name	Function	Description
33	TESTEN	I	Test enable signal (Active low)
34	SCK	I	IIC I/F clock signal
35	SDA	I/O	IIC I/F data
36	SCANEN	I	Scan enable (active high) or select DRAM outputs as TEST outputs when TESTEN is inactive
37	KASEL	I/O	DAC polarity selection pin or ST7 GPIO PA0
38	KTEST	I/O	User test mode selection or ST7 GPIO PA1
39	KSEARCH	I/O	Gain change during search or ST7 GPIO PA3
40	MSTOP	I/O	interrupt request/stand-by pin or ST7 GPIO PC5
41	SLEDL	I/O	SLED limit switch or ST7 GPIO PC6
42	K_VER_HOR	I/O	Indication of vertical or horizontal operation or ST7 GPIO PA4
43	WFCK	O	Write Frame clock for Subcode P-W output
44	EXCK	I	SBSO readout clock input
45	SBSO	O	Subcode P-W serial output
46	SCOR	O	Subcode sync output
47	DOUT	O	SPDIF Digital audio output
48	CS	I/O	ST7 GPIO PC4
49	SRQ	I/O	ST7 GPIO PC3
50	CORE_VDD_3	Vdd	Digital Power supply
51	CORE_VSS_3	Gnd	Digital Ground
52	DATAS	I/O	ST7 GPIO PC2
53	DATAM	I/O	ST7 GPIO PC1
54	CLK	I/O	ST7 GPIO PC0
55	DRS	I/O	Shock proof memory Read control
56	DWR	I/O	Shock proof memory Write control
57	CAS	I/O	Shock proof memory Column address select
58	RAS	I/O	Shock proof memory Row address select
59	DRA11	I/O	DRAM Address 11
60	DRA10	I/O	DRAM Address 10
61	DRA9	I/O	DRAM Address 9 or Mirror signal output
62	DRA8	I/O	DRAM Address 8 or TZC (Tracking Zero Cross) signal output
63	DRA7	I/O	DRAM Address 7 or FOK (Focus OK) signal output
64	DRA6	I/O	DRAM Address 6 or ST7 GPIO PB7 or PLLINF signal output

TDA7522

Pin Number	Name	Function	Description
65	DRA5	I/O	DRAM Address 5 or ST7 GPIO PB6 or OFS (FIFO Overflow) signal output
66	DRA4	I/O	DRAM Address 4 or ST7 GPIO PB5 or WFCK (Write Frame Clock) signal output
67	DRA3	I/O	DRAM Address 3 or ST7 GPIO PB4 or RFCK (Read Frame Clock) signal output
68	DRA2	I/O	DRAM Address 2 or ST7 GPIO PB3
69	DRA1	I/O	DRAM Address 1 or ST7 GPIO PB2
70	CORE_VDD_4	Vdd	Digital Power supply
71	CORE_GND_4	Gnd	Digital Ground
72	DRA0	I/O	DRAM Address 0 or ST7 GPIO PB1
73	DRD0	I/O	DRAM Data 0 or ST7 GPIO PA5
74	DRD1	I/O	DRAM Data 1 or ST7 GPIO PA6
75	DRD2	I/O	DRAM Data 2 or ST7 GPIO PA7
76	DRD3	I/O	DRAM Data 3 or ST7 GPIO PB0
77	SPDL	O	PWM/PDM Spindle motor control signal output
78	TFSR	O	PWM/PDM Tracking actuator control signal output
79	FFSR	O	PWM/PDM Focusing actuator control signal output
80	SFSR	O	PWM/PDM SLED motor control signal output

Note: 1. Depending from new DRAM selection pin nr.59 could be not used in production version.

B+D diode input		45		700	mVpp
E diode input		45		700	mVpp
F diode input		45		700	mVpp

4.0 STANDARD VERSION MEMORY MAP

The memory space, as seen by ST7 is defined in table 4; please take note that there are registers which are used for less than 8 bit or, on the other side, when read only certain bit contain useful information. Referred to appendix a to have a complete list of register structure.

Table 4. TDA7522 Memory Map

4.1 ST7 Scratch Memory Map

As far as concern ST7 scratch memory, it is mapped as follow:

```

00A0 - 00FF  RAM
0100 - 017F  Stack
0180 - 049F  RAM

```

total is 1024 Kbyte.

4.2 ST7 Interrupts Registers Configuration & Jump Table

The TDA7522 peripheral interrupt vector is as follows:

-Register MASK1[7:0]:

bit position	Description	Interrupt Name
MASK1[7]	NOT USED	
MASK1[6]	NOT USED	
MASK1[5]	SUB_IRQ_Q	Subcode extraction channel Q
MASK1[4]	SUB_IRQ_RW	Subcode extraction channel RW
MASK1[3]	SP_OVER	Shock Proof
MASK1[2]	I2C_INT	IIC
MASK1[1]	PLL_int	Analog PIII
MASK1[0]	DSP_shock	SAC-DSP

register MASK2[7:0]

bit position	Description	Interrupt Name
MASK2[7]	NOT USED	
MASK2[6]	NOT USED	
MASK2[5]	HSY_int	Digital PLL
MASK2[4]	EVD_int	Event detector
MASK2[3]	CIRC_over	Cross Interleave RS Code
MASK2[2]	reserved	
MASK2[1]	reserved	
MASK2[0]	KIF_IRQ	Kenwood interface.

Interrupts vector is reported below:

Interrupt Vector	Jump Address	Source Event	Source Peripheral
ITCPU11 :	ffe6	CIR_over	CIRC
ITCPU10 :	ffe8	EVD_int	Event Detector
ITCPU9 :	ffea	HSY_int	HFSync
ITCPU8 :	ffec	DSP_shock	SAC-DSP
ITCPU7 :	ffee	PLL_int	Analog PLL
ITCPU6 :	fff0	I2C_int	I2C
ITCPU5 :	fff2	SP_over	Shock Proof
ITCPU4 :	fff4	SUB_IRQ_RW	Subcode/Control Extraction
ITCPU3 :	fff6	SUB_IRQ_Q	Subcode/Control Extraction
ITCPU2:	fff8	TIMERINT	TIMER interrupt
ITCPU1 :	ffa	OEXTIT	PORT C interrupt
TRAP :	ffc	OTRAPIT	software interrupt
RESET :	ffe	OSTART	external reset.

Interrupt management it is fairly flexible, in detail, when an interrupt is served the I flag of the ST7 is automatically set (that means no other interrupts are served) and it is reset again only when the routine ends. No interrupts can be missed because of the internal software-based acknowledgement scheme for peripherals. In order to reset an interrupt coming from a peripheral you have to write to '0' a relevant flag inside it. With the TDA7522 interrupt mask register you just prevent the interrupt signal from coming to the ITC (interrupt controller) and so you can change the priority without losing any interrupt.

4.3 Development Version Memory Configuration

For system application development a dedicated version will be available: the development version gives the possibility of:

- use the ST7 emulator, for sw debug purpose;
- use of program RAM or ROM for sw execution and modification.

See appendix B for detail about memory map and TDA7522 operating modalities as:

- TDA7522 booting through I2C
- TDA7522 booting from PROM
- TDA7522 booting from PRAM.

When RAM is selected, all application sw shall be loaded through I2C, using the facility as gives by the boot ROM.

When RAM configuration is selected, memory addresses are just overlapping the ROM defined in memory map reported in appendix B.

TDA7522 development version can work also with emulator; refer to appendix B about the way to enter in “ST7 emulation” mode.

NOTICE: due to different environment the following registers can be different between various versions:

- **IIC register 27h: boot bit will disappear in production version**
- **KIF registers 75h and 76h are not available on development version**
- **Mux Registers 93h and 94h will both be available on production version.**

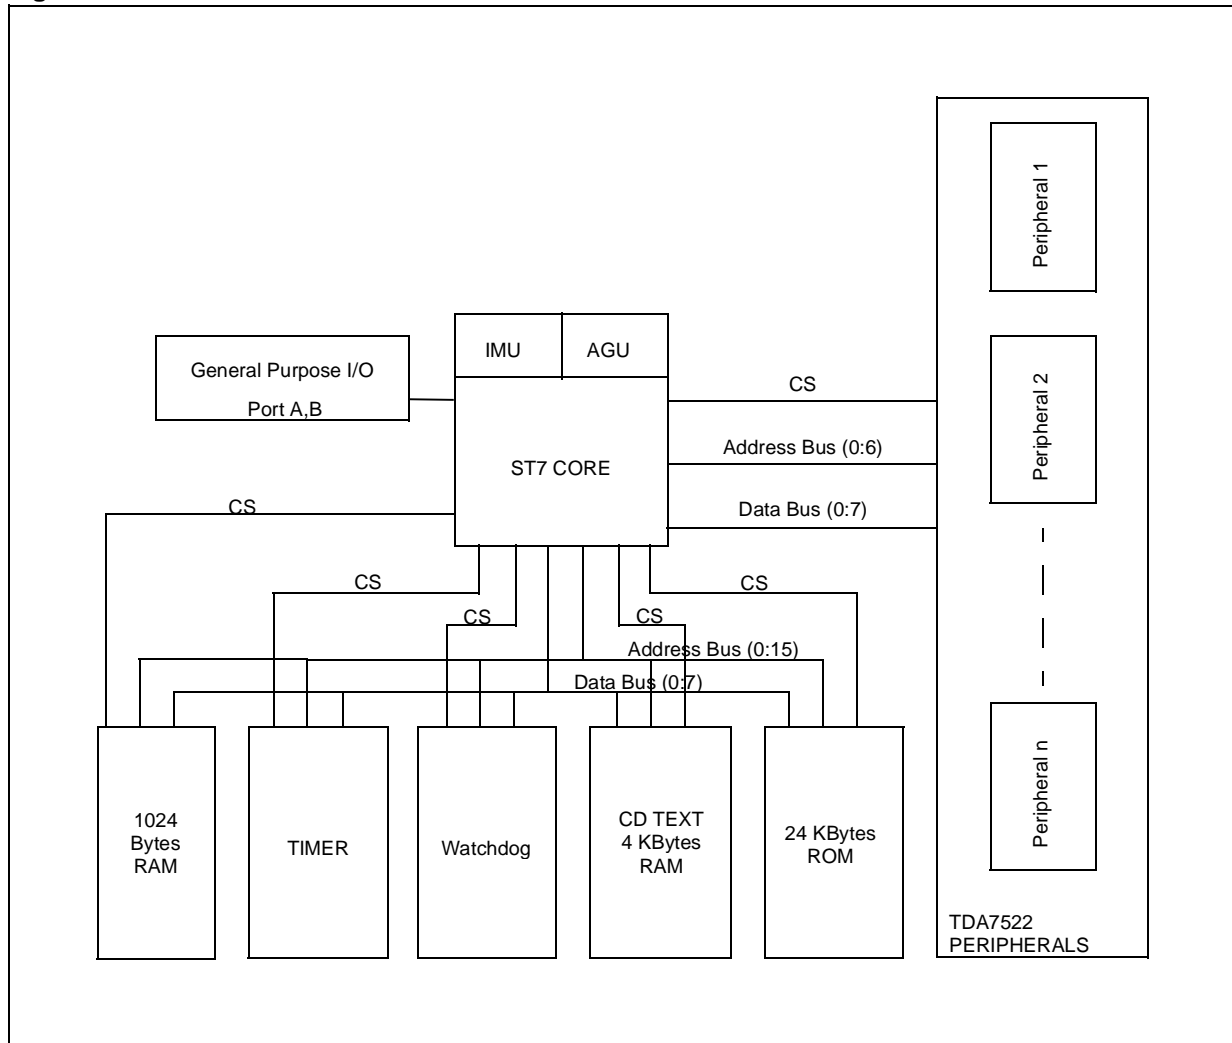

5.0 FUNCTION DESCRIPTION

5.1 ST7

ST7 is based around an industry standard 8 bit core and offers an enhanced instruction set. The processor runs with 8MHz internal clock. Due to fully static design of this device, operation down to DC is possible. Under software control the ST7 can be placed in Wait or Halt mode for reducing power consumption. ST7 can switch off crystal clock to disable complete functions of IC as well.

The enhanced instruction set and addressing modes afford real programming potential; in addition to standard 8 bit data management the ST7 features true bit manipulation, 8x8 unsigned multiplication and indirect addressing modes. The device includes a CPU, ROM, RAM, I/O, General I/O Port, 16 interrupt encoder, timer.

Figure 3. ST7 Interface Overview

ST7 is Supervisor of complete CD system such as Servo, Main Processor Communication, DSP control. Some Tasks of ST7 are as follows:

- Supervisor of all sub blocks
- Initialization of Coefficients for SAC-DSP Digital Servo
- Initialization of parameters of all sub blocks
- Focus search and quick restart
- Coarse Adjustments for Gain(Laser), Offset in Analog front end
- Fine Adjustments for Balance, Offset, Servo Gain in DSP
- Command interpreter and communication with external MPU
- Play & Subcode control, Music search, Random search, Program Play, Scan, Repeat etc.
- One, Ten and Long tracking jump and Pause implementation
- Linear velocity measurement (disc speed)
- Computation of the number of tracks for jump
- Shock proof memory control for data synchronization after shock

- Constant Angular Velocity Control
- TOC management
- CD-Text I/F.

5.2 DSP (SACDSP : Servo Audio Control Digital Signal Processor)

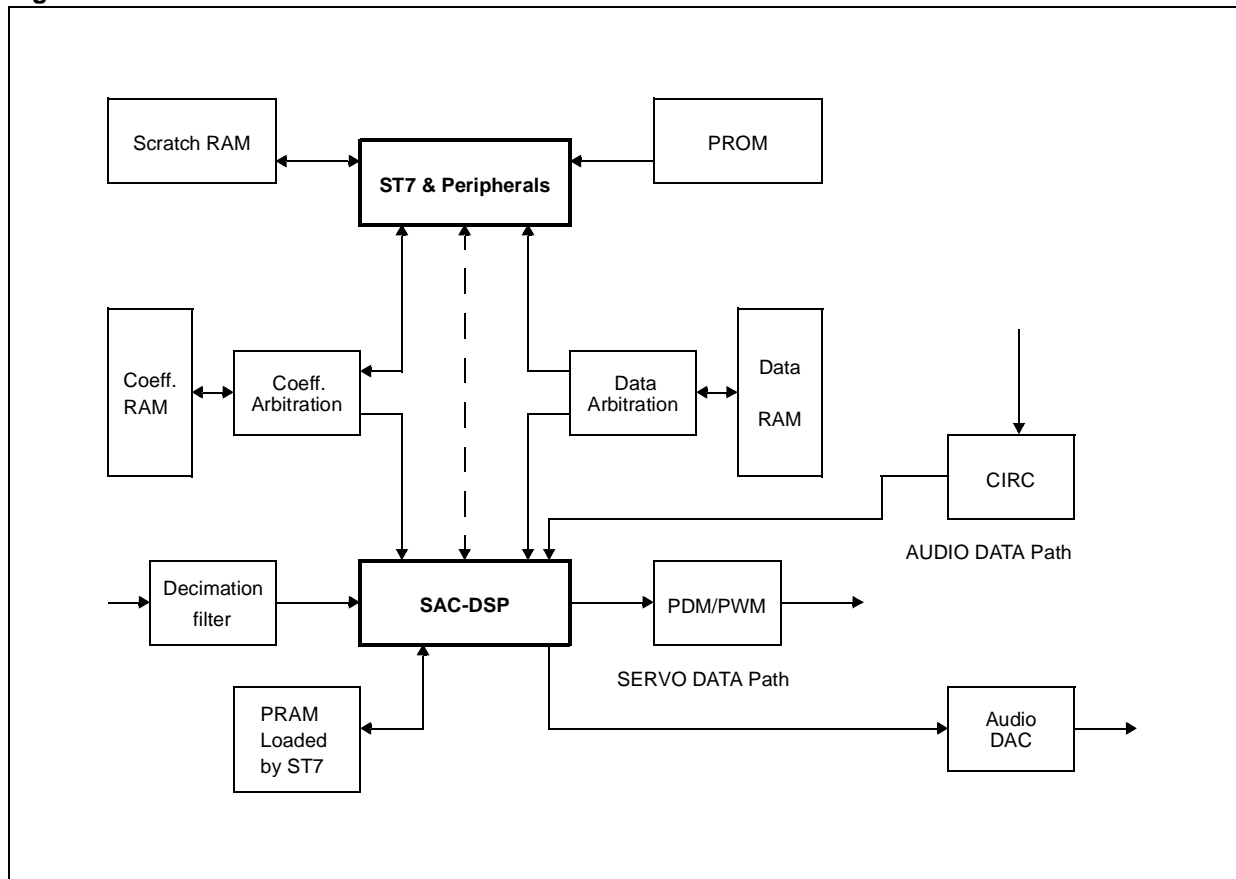

DSP is placed as a subset of ST7 MPU, which performs Digital Filter calculation.

It consists of 20bit (data) x 16bit (coefficient) multiplier, 38bit accumulator, 20bit Data RAM, Data Arbitration between ST7, and 19 bits wide program Opcode; it can be broken down into two instruction bindings:

- Instruction binding #1 :Arithmetic Instructions + Parallel Move Instructions
- Instruction binding #2 :Immediate moves and bit-test jumps

SACDSP is very powerful DSP which performs more than 50MIPS, and it is based on three level pipeline architecture in which concurrent instruction fetch, decode, and execution occur.

Figure 4. Basic I/Fs to ST7

Some Tasks of SACDSP are as follows;

- DSP: Digital Filter execution as slave of ST7
- Focusing and Tracking loop filter
- Sled Tracking control
- Pick-up Velocity control during Jump

- Some Digital filters for Adjustments by ST7
- Sine wave generator for reference of internal adjustment and DAC measurement
- Filter for Shock detector
- 8 times high end Audio Over sampling
- De-emphasis filter
- Audio attenuation, mute and balance
- Internal Signal observation feature for user measurement
- Soft mute and data concealment
- Audio peak detection
- Focus error, Tracking error generation
- Equalization of Tracking Zero Cross signal
- Sound Vector Enhancement filter.

5.3 DATA Acquisition

The digital HF signal is input to an digital equalizer to improved the bit detection. Different equalizer coefficients are selectable by MPU.

The digital data slicer is implemented and the internal slice level is calculated by using a leakage free integrator which is subtracted from HF. The properly levelled EFM is delivered to the edge detector and a digital bit clock PLL. On this stage, no analog VCO is necessary to obtain bit clock but DTO (Discrete Time Oscillator) is used.

The Digital PLL block consists of following functions;

- Adaptive HF Equalization
- HF HPF for disturbance rejection
- Digital Data slicer
- Linear interpolation for Phase error measurement
- Run length detection for Frequency error measurement
- Frequency & Phase Control loop
- DTO block
- EFM bit generation.

The serial bit stream signal from the phase detected is sent to a shift register block, which includes different functions as follows;

- serial to parallel conversion
- detection of frame sync pattern
- protection and insertion of frame sync
- bit clock counter (588 bits per frame)
- synchronization and sync window logic
- 14 to 8 bit demodulation
- subcode extraction.

5.4 Subcode extraction

This block receives the subcode data stream and the related S0/S1 synchronization information from Acquisition part.

Subcode processing consists of CRC parity check and Subcode decoder.

There are 2 different buffers for Q Subcode data and for R-W subcode data.

Q subcode data is transferred to ST7 every symbol by interruption and the result of CRC is also reported to ST7. R-W subcode data especially for CD-Text data through program area is arranged to 8bit format from 6bit of R to W, then ST7 stores max. 144byte (8pack data) as a FIFO to allow the tolerant of reading timing from external MPU for display and also 1block CD-Text data from TOC area can be transferred to ST7 4Kbyte CD-Text RAM.

5.5 CIRC (Error correction)

CIRC (Cross Interleaving Read Solomon code) consists of 2 following blocks;

- Memory control for
 - M1: The FIFO memory to absorb Jitter of input signals
 - M2: The De-interleaving memory

M1 FIFO memory compensates the speed deviations of the spindle motor and M2 is used for the de-interleaving between the C1 and C2 decoder. The size of the RAM is 16Kbit and the width is 9bit. Each 9 bit word consists of 8 bit data (symbols) and 1 bit validity flag.

- Error Correction
 - This block represents a Reed Solomon decoder which forms a CIRC decoder for CD in conjunction with CIRC RAM.

There are two decoder circuits:

- the first C1 decoder can correct up two random errors in a 32-byte frame, marking uncorrectable errors as erasures
- the second C2 decoder can correct up to four erasures in a 28 byte frame.

5.6 Shock proof memory control

This is a shock proof memory controller which absorbs the interruption due to the shocks.

Namely, it controls external DRAM in order to store the audio data into RAM earlier than the reading. Therefore during shocks the data of the RAM can be played without any interruption of the data.

The controller handles the data from Acquisition and output into RAM&Timing block. It means the stored data into RAM is ADAT[7-0] before error correction. That is why complete 32 Symbols / Frame including CRC must be stored into RAM. It allows the use of Audio RAM (ARAM) with defects which is much cheaper than standard DRAM.

The difference between the classical shock proof memory controller like SONY and this new controller is that ARAM use with defects, the location of the memory and the controller, and also how to fill the data into RAM earlier than reading. In case of our controller, CLV servo (Disk motor controller) varies the disk speed in order to store certain amount of data into RAM earlier than the reading. Then as long as certain amount of data is kept in the RAM in advance, the disk speed is controlled with single speed (normal speed) operation, not always double speed operation like classical solution.

Mainly the shock proof memory controller consists of 3 controllers.

One is the writing pointer controller which controls the memory address for writing data, the another is the reading pointer controller which controls the memory address for reading data, the other is timing arbitration between the reading and writing procedure of the data and address.

The output data from the memory is delivered always with fixed data rate without jitters, however the incoming data is not delivered with fixed rate because of the jitters from the disk and the varied speed of the

disk motor, so the data rate changes within the capture range of the digital PLL in the Acquisition part. So output data has no jitters that M1 buffer memory in RAM&Timing can be replaced with the shock proof memory. (as a huge time base collector instead of M1 buffer memory).

5.7 CLV & CAV

This is a spindle motor (Disc motor) servo controller which performs Constant Linear Velocity. (CLV)

The normal velocity is about from 1.2m/s to 1.4m/s, it means disc speed is of course depending on the location of the pick-up. When pick-up is inside of the disc, disc speed reaches about 8 rotations/sec, and in case of outside, the speed is about 3 rotations/sec.

Mainly the CLV servo consists of 3 controllers, one is rough servo controller which controls to reach certain speed which is within the capture range of the PLL (See Acquisition part).

The another one is frequency servo controller which controls to keep certain frequency of writing clock for FIFO memory (M1 memory) comes from CIRC or shock proof memory controller in future.

The other one is phase servo which controls to keep certain constant phase between the writing clock and reading clock for FIFO memory.

As long as PLL is locked, the frequency servo and the phase servo work and normally there is no overflow or underflow of the FIFO memory. (FIFO memory works as a time base corrector).

CAV (Constant Angular Velocity) control is done by ST7 by detecting the period of eccentricity from the disc.

5.8 Audio I/F & DAC

This block represents both of Standard Audio serial format based on Sony LSI I/F for external DAC or CD-ROM decoder, and Audio bit stream with 1bit Delta Sigma technic for Analog stage of 1bit DAC (in TDA7521).

The Delta Sigma block consists of functions shown in figure 7.8-1.

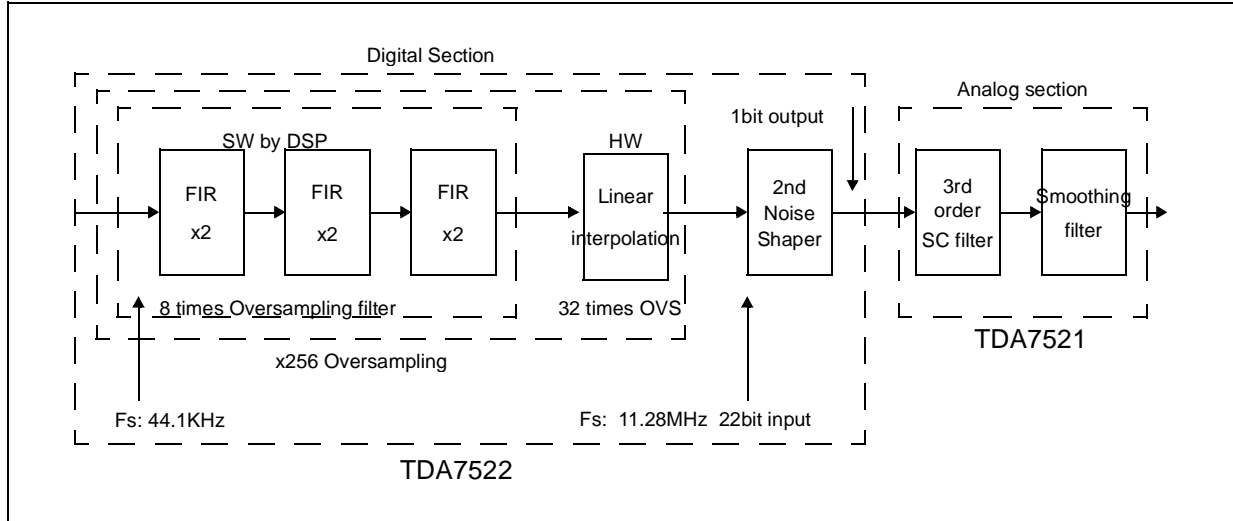

5.9 Disturbance detector

This block detects Focus OK, Mirror signal, Defect signals, (Shock is detected by DSP in a Tracking loop filter, and Interruption is detected in Data Acquisition block).

These disturbance signals are used mainly in Servo block to improve the Robustness of the controller.

Mirror signal is used for Track jump with TZC (Tracking Zero Cross) signal, it is handled by ST7 and also input to 16bit Track Up/Down counter which counts physical number of tracks during tracking Jump.

Figure 5. Delta Sigma Functions

5.10 Decimation filter

This is for Down sampling filter of Diode signals which have been digitized with Oversampling in Analog stage (TDA7521).

Input Signals are A+C, B+D, E, F diode signals;

Initial sampling frequency

48Fs (2.1168MHz) / 96Fs (4.2336MHz) for 2x, 4x speed
 6 bit resolutions from ADC

After Downsampling

2Fs (88.2KHz) / 4Fs (176.4KHz) for 2x, 4x speed
 10 bit resolutions into Servo Block

Downsampling ratio

24times.

5.11 PDM/PWM

This is a single end output stage of Tracking, Focusing actuator, Sled and Spindle motor signal using following technic.

Pulse-width modulation (PWM)

Pulse density modulation (PDM)

There are 8 bit Output accuracy.

5.12 SPDIF

This is a decoder to output Audio&Subcode data based on standard format of AES/EBU digital output.

5.13 ADC Characteristics

Resolution:	8-bits
Conversion rate:	27.7 kHz (assuming a ST7 clock equal to 4 MHz)
Conversion type:	Successive approximation (12 sar cycles/conversion)
Operation mode:	Continuous conversion, asynchronous read/write
Power supply:	3.3 V +/- 10%
Voltage Reference:	1.25 V
Analogue input:	0 to 1.25 V
