### MARKING

### GENERAL DESCRIPTION

The GVT7232A8 is organized as a 32,768 x 8 SRAM using a four-transistor memory cell with a high performance, silicon gate, low-power CMOS process. Galvantech SRAMs are fabricated using double-layer polysilicon, double-layer metal technology.

Static design eliminates the need for external clocks or timing strobes. For increased system flexibility and eliminating bus contention problems, this device offers one chip enable (CE#) along with output enable (OE#) for this organization.

The chip is enabled when CE# is LOW. With chip being enabled, writing to this device is accomplished when write enable (WE#) is LOW and reading is accomplished when (OE#) go LOW with (WE#) remaining HIGH. The device offers a low power standby mode when chip is not selected. This allows system designers to meet low standby power requirements.
