

LT1357

25MHz, 600V/μs Op Amp

FEATURES

- 25MHz Gain-Bandwidth
- 600V/μs Slew Rate
- 2.5mA Maximum Supply Current
- Unity Gain Stable
- C-Load™ Op Amp Drives All Capacitive Loads
- 8nV/√Hz Input Noise Voltage
- 600μV Maximum Input Offset Voltage
- 500nA Maximum Input Bias Current
- 120nA Maximum Input Offset Current
- 20V/mV Minimum DC Gain, $R_L=1k$
- 115ns Settling Time to 0.1%, 10V Step
- 220ns Settling Time to 0.01%, 10V Step
- ±12.5V Minimum Output Swing into 500Ω
- ±3V Minimum Output Swing into 150Ω
- Specified at ±2.5V, ±5V, and ±15V

APPLICATIONS

- Wideband Amplifiers
- Buffers
- Active Filters
- Data Acquisition Systems
- Photodiode Amplifiers

DESCRIPTION

The LT1357 is a high speed, very high slew rate operational amplifier with outstanding AC and DC performance. The LT1357 has much lower supply current, lower input offset voltage, lower input bias current, and higher DC gain than devices with comparable bandwidth. The circuit topology is a voltage feedback amplifier with the slewing characteristics of a current feedback amplifier. The amplifier is a single gain stage with outstanding settling characteristics which makes the circuit an ideal choice for data acquisition systems. The output drives a 500Ω load to ±12.5V with ±15V supplies and a 150Ω load to ±3V on ±5V supplies. The amplifier is also stable with any capacitive load which makes it useful in buffer or cable driver applications.

The LT1357 is a member of a family of fast, high performance amplifiers using this unique topology and employing Linear Technology Corporation's advanced bipolar complementary processing. For dual and quad amplifier versions of the LT1357 see the LT1358/LT1359 data sheet. For higher bandwidth devices with higher supply current see the LT1360 through LT1365 data sheets. For lower supply current amplifiers see the LT1354 and LT1355/LT1356 data sheets. Singles, duals, and quads of each amplifier are available.

C-Load is a trademark of Linear Technology Corporation

TYPICAL APPLICATION

DAC I-to-V Converter

$A_V = -1$ Large-Signal Response

1357 TA02

LT1357

ABSOLUTE MAXIMUM RATINGS

Total Supply Voltage (V^+ to V^-) 36V
Differential Input Voltage $\pm 10V$
Input Voltage $\pm V_S$
Output Short-Circuit Duration (Note 1) Indefinite
Operating Temperature Range -40°C to 85°C

Specified Temperature Range -40°C to 85°C
Maximum Junction Temperature (See Below)
Plastic Package 150°C
Storage Temperature Range -65°C to 150°C
Lead Temperature (Soldering, 10 sec) 300°C

The ● denotes specifications that apply over the full operating temperature range.

Note 1: A heat sink may be required to keep the junction temperature below absolute maximum when the output is shorted indefinitely.

Note 2: Slew rate is measured between $\pm 10\text{V}$ on the output with $\pm 6\text{V}$ input for $\pm 15\text{V}$ supplies and $\pm 1\text{V}$ on the output with $\pm 1.75\text{V}$ input for $\pm 5\text{V}$ supplies.

Note 3: Full power bandwidth is calculated from the slew rate measurement: $\text{FPBW} = \text{SR}/2\pi V_p$.

Note 4: This parameter is not 100% tested.

Note 5: The LT1357 is not tested and is not quality-assurance sampled at -40°C and at 85°C . These specifications are guaranteed by design, correlation, and/or inference from 0°C , 25°C , and/or 70°C tests.

APPLICATIONS INFORMATION

The LT1357 may be inserted directly into many high speed amplifier applications improving both DC and AC performance, provided that the nulling circuitry is removed. The suggested nulling circuit for the LT1357 is shown below.

Offset Nulling

1357 AI01

Layout and Passive Components

The LT1357 amplifier is easy to apply and tolerant of less than ideal layouts. For maximum performance (for example fast settling time) use a ground plane, short lead lengths, and RF-quality bypass capacitors ($0.01\mu\text{F}$ to $0.1\mu\text{F}$). For high drive current applications use low ESR bypass capacitors ($1\mu\text{F}$ to $10\mu\text{F}$ tantalum). Sockets should be avoided when maximum frequency performance is required, although low profile sockets can provide reasonable performance up to 50MHz. For more details see Design Note 50.

The parallel combination of the feedback resistor and gain setting resistor on the inverting input can combine with the input capacitance to form a pole which can cause peaking or oscillations. For feedback resistors greater than $5\text{k}\Omega$, a parallel capacitor of value

$$C_F > R_G \times C_{IN}/R_F$$

should be used to cancel the input pole and optimize dynamic performance. For unity-gain applications where a large feedback resistor is used, C_F should be greater than or equal to C_{IN} .

Capacitive Loading

The LT1357 is stable with any capacitive load. This is accomplished by sensing the load induced output pole and adding compensation at the amplifier gain node. As the capacitive load increases, both the bandwidth and phase margin decrease so there will be peaking in the frequency domain and in the transient response as shown in the typical performance curves. The photo of the small-signal response with 1000pF load shows 50% peaking. The large signal response with a $10,000\text{pF}$ load shows the output slew rate being limited to $5\text{V}/\mu\text{s}$ by the short-circuit current. Coaxial cable can be driven directly, but for best pulse fidelity a resistor of value equal to the characteristic impedance of the cable (i.e., 75Ω) should be placed in series with the output. The other end of the cable should be terminated with the same value resistor to ground.

APPLICATIONS INFORMATION

Input Considerations

Each of the LT1357 inputs is the base of an NPN and a PNP transistor whose base currents are of opposite polarity and provide first-order bias current cancellation. Because of variation in the matching of NPN and PNP beta, the polarity of the input bias current can be positive or negative. The offset current does not depend on beta matching and is well controlled. The use of balanced source resistance at each input is recommended for applications where DC accuracy must be maximized. The inputs can withstand differential input voltages of up to 10V without damage and need no clamping or source resistance for protection.

Power Dissipation

The LT1357 combines high speed and large output drive in a small package. Because of the wide supply voltage range, it is possible to exceed the maximum junction temperature under certain conditions. Maximum junction temperature (T_J) is calculated from the ambient temperature (T_A) and power dissipation (P_D) as follows:

$$\text{LT1357CN8: } T_J = T_A + (P_D \times 130^\circ\text{C/W})$$

$$\text{LT1357CS8: } T_J = T_A + (P_D \times 190^\circ\text{C/W})$$

Worst case power dissipation occurs at the maximum supply current and when the output voltage is at 1/2 of either supply voltage (or the maximum swing if less than 1/2 supply voltage). Therefore $P_{D\text{MAX}}$ is:

$$P_{D\text{MAX}} = (V^+ - V^-)(I_{S\text{MAX}}) + (V^+/2)^2/R_L$$

Example: LT1357CS8 at 70°C , $V_S = \pm 15\text{V}$, $R_L = 120\Omega$
(Note: the minimum short-circuit current at 70°C is 25mA, so the output swing is guaranteed only to 3V with 120Ω .)

$$P_{D\text{MAX}} = (30\text{V})(2.9\text{mA}) + (15\text{V}-3\text{V})(25\text{mA}) = 387\text{mW}$$

$$T_{J\text{MAX}} = 70^\circ\text{C} + (387\text{mW})(190^\circ\text{C/W}) = 144^\circ\text{C}$$

Circuit Operation

The LT1357 circuit topology is a true voltage feedback amplifier that has the slewing behavior of a current feedback amplifier. The operation of the circuit can be understood by referring to the simplified schematic. The inputs are buffered by complementary NPN and PNP emitter followers which drive a 500Ω resistor. The input voltage appears across the resistor generating currents which are mirrored into the high impedance node. Complementary followers form an output stage which buffers the gain node from the load. The bandwidth is set by the input resistor and the capacitance on the high impedance node. The slew rate is determined by the current available to charge the gain node capacitance. This current is the differential input voltage divided by R_1 , so the slew rate is proportional to the input. Highest slew rates are therefore seen in the lowest gain configurations. For example, a 10V output step in a gain of 10 has only a 1V input step, whereas the same output step in unity gain has a 10 times greater input step. The curve of Slew Rate vs Input Level illustrates this relationship. The LT1357 is tested for slew rate in a gain of -2 so higher slew rates can be expected in gains of 1 and -1 , and lower slew rates in higher gain configurations.

The RC network across the output stage is bootstrapped when the amplifier is driving a light or moderate load and has no effect under normal operation. When driving a capacitive load (or a low value resistive load) the network is incompletely bootstrapped and adds to the compensation at the high impedance node. The added capacitance slows down the amplifier which improves the phase margin by moving the unity gain frequency away from the pole formed by the output impedance and the capacitive load. The zero created by the RC combination adds phase to ensure that even for very large load capacitances, the total phase lag can never exceed 180 degrees (zero phase margin) and the amplifier remains stable.

TYPICAL APPLICATIONS

Instrumentation Amplifier

$$A_V = \frac{R_4}{R_3} \left[1 + \frac{1}{2} \left(\frac{R_2}{R_1} + \frac{R_3}{R_4} \right) + \frac{R_2 + R_3}{R_5} \right] = 104$$

TRIM R5 FOR GAIN
TRIM R1 FOR COMMON-MODE REJECTION
BW = 250kHz

1357 TA03

200kHz, 4th Order Butterworth Filter

1357 TA04

SIMPLIFIED SCHEMATIC

1357 SS01

LT1357

PACKAGE DESCRIPTION

Dimension in inches (millimeters) unless otherwise noted.

N8 Package 8-Lead Plastic DIP

S8 Package 8-Lead Plastic SOIC

*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.006 INCH (0.15mm).

S08 0294
