

DUAL OPERATIONAL TRANSCONDUCTANCE AMPLIFIER

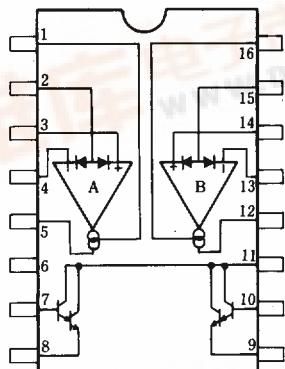

■ GENERAL DESCRIPTION

The NJM13600/13700 consist of two current controlled transconductance amplifiers each with differential inputs and a push pull output. The two amplifiers share common supplies but otherwise operate independently. Linearizing diodes are provided at the inputs to reduce distortion and allow higher input levels. The results is a 10 dB signal-to-noise improvement referenced to 0.5 percent THD. Controlled impedance buffers are provided which are especially designed to complement the dynamic range of the amplifiers.

■ FEATURES

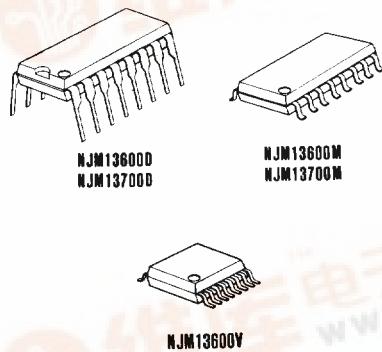

- Package Outline DIP16, DMP16, (SSOP16)
- Bipolar Technology

■ PIN CONFIGURATION

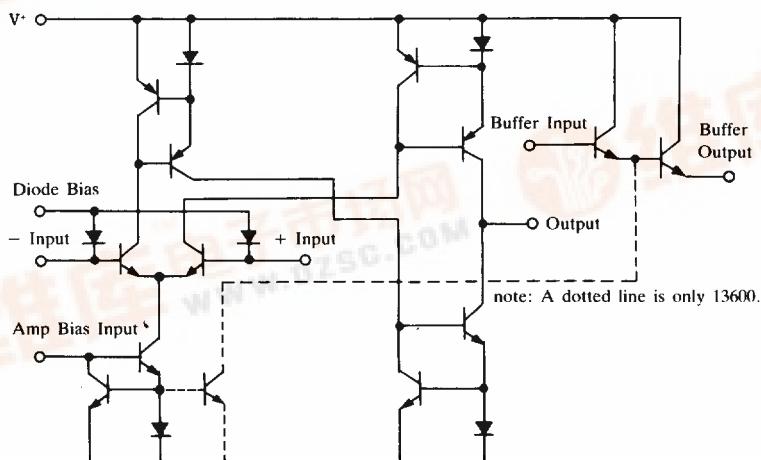

NJM13600, NJM13600M, NJM13600V
NJM13700, NJM13700M,
