SIEMENS

TV-Stereo Processor TDA 6812-2M

Preliminary Data **Bipolar IC**

Features

- High quality stereo signal processing
- High S/N ratio
- I²C Bus controlled
- Clipping detector and clock generator
- NICAM or AM sound inputs
- Volume control
- Universal audio interface for DOLBY, EQUALIZER, SURROUND SOUND features
- Multiplex of 3-SCART connections
- Independent headphones

P-MQFP-44-2

Type	Ordering Code	Package
TDA 6812-2M	Q67000-A5218	P-MQFP-44-2

TDA 6812-2 is a complete system for stereo TV-sound, controlled by an I²C Bus. The device is made up of three functional blocks.

1. **Stereo Processing with High Quality** (better than DIN 45500; suitable for NICAM and CD
   a) Matrix for G-standard with I²C-controlled crosstalk compensation; selectable gain 0/6 dB
   b) Three stereo AF-inputs
   c) Random switching of all inputs to all outputs
   d) Stereo SCART-interface
   e) Stereo loudspeaker signal section with volume precontrol, treble/bass control, enlargement of quasi-stereo/stereo sound base, separate L/R-volume control (V_{max} 10 dB), equalizer interface in front of tone control
   f) Stereo headphones signal section with Ch1/Ch2 and volume control

2. **TV-Identification-Signal Decoder**
   a) Active pilot-tone filter
   b) Phase-independent rectifier with very narrow bandwidth for identification-signal decoding
   c) Digital integrator for noise rejection
   d) Multiplexer for cyclic scanning for stereo or dual-sound identification
   e) Externally synchronized PLL for reference-signal generation: synchronization with line sync pulse or 62.5-kHz clock, integrated crystal oscillator and 4-MHz crystal, or with external 4-MHz timing signal

3. Control

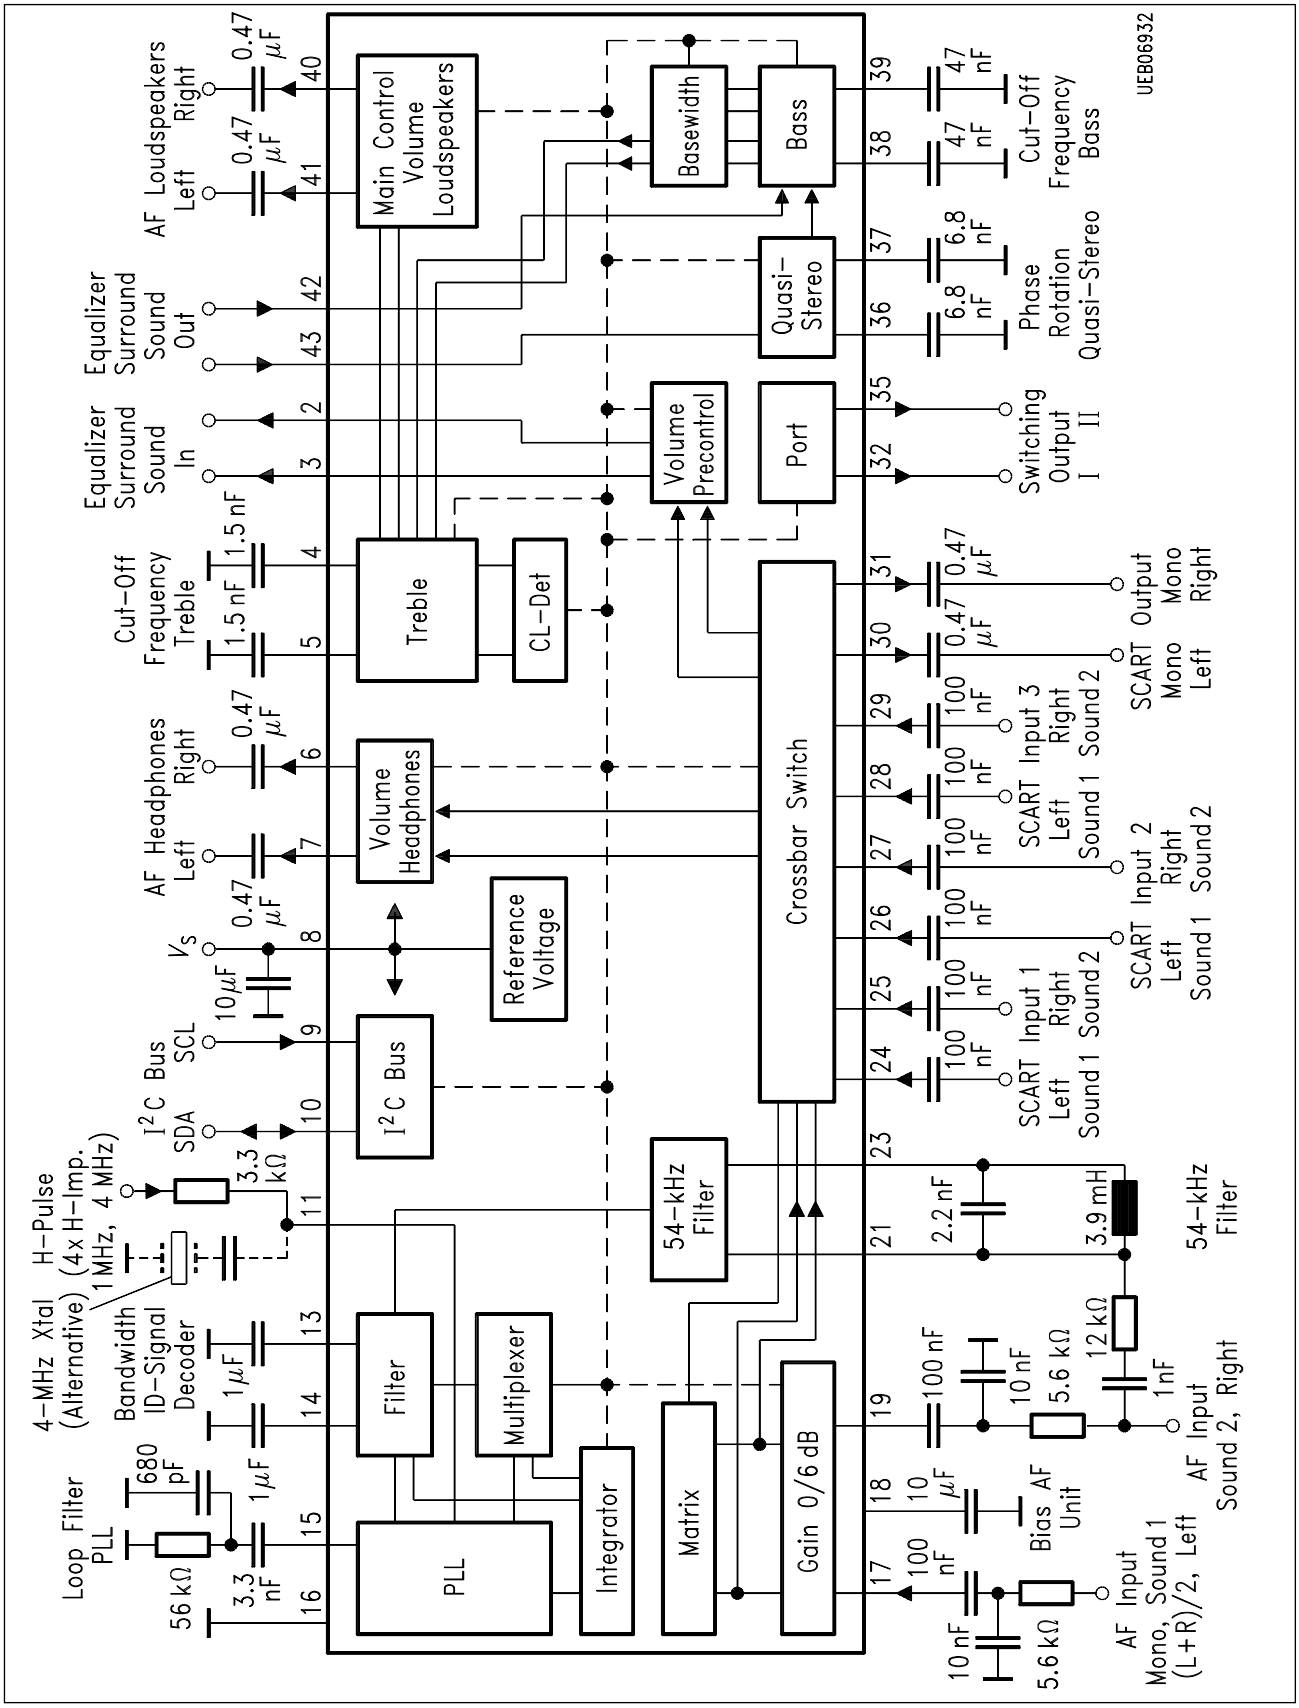
a) I²C Bus interface with listen/talk function
b) Control of entire audio processing
c) Reading of clipping detector
d) Control of identification-signal decoder
e) Reading of identification-signal decoder
f) Test modes

Pin Functions

Pin No.	Function
1	N.C.
2	AF-output, equalizer, right channel
3	AF-output, equalizer, left channel
4	Cut-off frequency treble, left channel
5	Cut-off frequency treble, right channel
6	AF-output, headphones, right channel
7	AF-output, headphones, left channel
8	+ V_S (supply voltage)
9	I²C Bus SCL
10	I²C Bus SDA
11	Input line sync pulse (4 x H-pulse), crystal oscillator
12	N.C.
13	Identification-signal decoder, filter
14	Identification-signal decoder, filter
15	Identification-signal decoder, PLL-filter
16	Ground
17	AF-input mono or left, sound 1 (adjustable)
18	Bias AF-operating point
19	AF-input, right, sound 2
20	N.C.
21	54-kHz input
22	N.C.
23	54-kHz filter
24	SCART-input 1, left channel

Pin Functions (cont'd)

Pin No.	Function
25	SCART-input 1, right channel
26	SCART-input 2, left channel
27	SCART-input 2, right channel
28	SCART-input 3, left channel
29	SCART-input 3, right channel
30	AF-output SCART (mono, sound 1, left channel)
31	AF-output SCART (mono, sound 2, right channel)
32	Output port 1 (open collector)
33	N.C.
34	N.C.
35	Output port 2 (open collector)
36	Phase shifter quasi-stereo
37	Phase shifter quasi-stereo
38	Cut-off frequency bass (sound base), left channel
39	Cut-off frequency bass (sound base), right channel
40	AF-output, loudspeaker, right channel
41	AF-output, loudspeaker, left channel
42	AF-input, volume control, right channel
43	AF-input, volume control, left channel
44	N.C.



Block Diagram

Circuit Description

Signal Section

The dematrixing and switching of multichannel TV-sound signals are performed in the matrix and switch section by the dual-carrier method. Crosstalk compensation is on the sound 1 input. The compensation stage has a range of ± 3 dB with a smallest increment of 0.2 dB, and gain can also be switched between 0 and 6 dB. In addition to the two inputs for the demodulated sound carriers, there are three dual-channel SCART-inputs. The two matrix AF-inputs can be bypassed internally so that decoded stereo signals of other systems (NICAM) can also be processed. The switch section terminates in the SCART-output and signal paths for the loudspeaker and headphones outputs. AF-inputs can be randomly switched to AF-outputs (8-6 matrix).

In the loudspeaker signal path there is an initial volume control with a range of 0/– 15 dB and an increment of 1.25 dB. In conjunction with the main volume control that follows the tone control, very high overdriving immunity is ensured. In front of tone control there is an AF input/output interface in an equalizer or a DOLBY surround system. The switchable quasi-stereo section that follows produces a stereo listening effect for mono signals through a 180 ^{o}C phase shift at mid-range frequencies (approx. 1 kHz) in one channel. The following bass control has an increment of 3 dB in its setting range of + 15/– 12 dB. The cut-off frequency for each channel is set by an external capacitor. The circuit for enlarging the stereo sound base can be cut in for stereo signals to make the aural impression even more stereo-like by frequency-dependent antiphase crosstalk of 55 %. This works with the same cut-off frequency as the bass control, but the function is largely independent. The treble control, whose cut-off frequency is also set by an external capacitor, likewise has an increment of 3 dB in a setting range of ± 12 dB. The main value control with maximum gain of 10 dB, which can be adjusted separately for L and R, terminates the loudspeaker signal path. 57 steps with an increment of 1.25 dB mean a setting range of 71.25 dB. Functions like balance or loudness are implemented by software setting of the appropriate tone and volume controls. In the tone-control section there is a clipping detector that can be read on the I^2C Bus and enables automatic volume correction by the controller. After each reading the clipping bit is reset, which enables a renewed check for clipping with each I^2C Bus read operation.

The headphones signal path includes a volume control with joint L/R-setting. 32 increments of 2 dB produce a range of 62 dB (31 x 2 dB = 62 dB).

Identification-Signal Decoder

The input of the identification-signal decoder consists of an operational amplifier for selectivity of the pilot tone and its sidebands with an external LC-circuit. The signal is fed to a phase-independent active bandpass filter of very narrow bandwidth (externally adjustable) that detects the presence of the lower sideband of the pilot carrier modulated with the identification signal. The center frequency of the filter is switched back and forth between dual and stereo by a multiplexer (software-controlled timing). The multiplexer halts when a sideband is detected. This first "detected" criterion is freed from noise by a digital integrator followed by a comparator and can then be read on the I^2C Bus (talker) as stereo or dual mode. The µC controls the signal paths. All necessary timing signals are derived from a fast settling PLL synchronized by a reference frequency. This reference must be sufficiently identical to the horizontal frequency, **but no phase locking is necessary**. This means that it is possible to use the crystal-controlled frequency of 62.5 kHz that is often found in PLL-tuning

systems. As further alternatives there is an integrated crystal oscillator that requires a 4-MHz crystal, or it is possible to use a clock frequency of 1 or 4 MHz.

Control Section

All functions are controlled by an I^2C Bus interface which can be both a listener and a talker. The currently valid data are stored in a latch block. The telegram structure is as follows:

start condition - chip address - any number of bytes - stop condition

The following conditions apply to the data bytes:

Before the actual data byte (with setting information) a subaddress byte **must always be** transmitted, which the I^2C Bus still interprets as a data byte.

Example: Headphones (HP) volume is to be increased in several steps.

Right	**Wrong**
Start condition Chip address 84 (Hex) Subaddress volume HP 03 (Hex) Volume Step 8 08 (Hex) Subaddress volume HP 03 (Hex) Volume step 9 09 (Hex) Subaddress volume HP 03 (Hex) Volume Step 10 0A (Hex) Stop condition	Start condition Chip address 84 (Hex) Subaddress volume HP 03 (Hex) Volume Step 8 08 (Hex) Volume step 9 09 (Hex) Volume Step 10 0A (Hex) Stop condition

Different subaddresses can be used within a telegram, i.e. without a new start condition. But the change between listener and talker must always be made by stop condition - start condition - chip address. A start condition and a chip address (talk) must always be transmitted before reading. This loads the data that are to be read out on the I^2C Bus interface for transfer to the µC.

Chip Address

MSB	•	•	•	•	•	•	LSB
1	0	0	0	0	1	0	R/W

R/W = 0 → Read (Listen)

R/W = 1 → Write (Talk)

Subaddress Bytes

	MSB	•	•	•	•	•	•	LSB
Volume precontrol	X	X	X	X	0	0	0	0
Volume left speaker	X	X	X	X	0	0	0	1
Volume right speaker	X	X	X	X	0	0	1	0
Volume headphones	X	X	X	X	0	0	1	1
Treble/bass	X	X	X	X	0	1	0	0
Switching byte I	X	X	X	X	0	1	1	0
Switching byte II	X	X	X	X	0	1	1	1
Switching byte III	X	X	X	X	1	0	0	0
Switching byte IV	X	X	X	X	1	0	0	1
Crosstalk compensation	X	X	X	X	0	1	0	1

Setting Bytes
a) Volume Precontrol

	MSB	•	•	•	•	•	•	LSB
Maximum volume	X	H	Q	0	0	0	0	X
Max. – 1	X	H	Q	0	0	0	1	X
Min. + 1	X	H	Q	1	0	1	1	X
Minimum volume	X	H	Q	1	1	0	0	X
Power ON	0	0	0	0	0	0	0	1

H = 0 Identification-signal decoder synchronization with f_H = 15.625 kHz; power ON
H = 1 Identification-signal decoder synchronization with 4 x f_H (must be 1 for operation with crystal or 4-MHz reference frequency)
Q = 0 PLL synchronization with line sync pulse; power ON
Q = 1 PLL synchronization with crystal oscillator (the bit for H must also be set to 1)

b) L/R-Loudspeaker Volume

	MSB	•	•	•	•	•	•	LSB
Maximum volume	X	X	1	1	1	1	1	1
Max. – 1	X	X	1	1	1	1	1	0
Max. – 15	X	X	1	1	0	0	0	0
Minimum volume	X	X	0	0	1	0	0	0
Power ON	0	0	0	0	0	0	0	1

c) Headphones Volume

	MSB	•	•	•	•	•	•	LSB
Maximum volume	T2	T1	T0	1	1	1	1	1
Max. – 1	T2	T1	T0	1	1	1	1	0

Max. treble, max. bass	1	1	X	X	1	1	X	1
Min. treble, min. bass	0	0	X	X	0	0	X	X
Power ON	0	0	0	0	0	0	0	1
	MSB treble			LSB treble	MSB bass			LSB bass

f) Switching Bytes I, II, III

Switching Byte I SCART-output
Switching byte II Headphones output
Switching byte III Loudspeaker output

MSB	•	•	•	•	•	•	LSB	
L3 0	L2 0	L1 0	L0 0	R3 0	R2 0	R1 0	R0 1	Power ON

L0 thru L3 left output, R0 thru 3 right output.

L3	**L2**	**L1**	**L0**	**Selected Input**
0	0	0	0	MUTE
0	0	0	1	AF-input left, mono, sound 1
0	0	1	0	AF-input right, sound 2
0	0	1	1	AF-input left, dematrixed
0	1	0	0	SCART 1 left
0	1	0	1	SCART 1 right
0	1	1	0	SCART 2 left
0	1	1	1	SCART 2 right
1	0	0	0	SCART 3 left
1	0	0	1	SCART 3 right

Assignment R3 thru R0 is identical to L3 thru L0.

g) Switching Byte IV

MSB	•	•	•	•	•	•	LSB
MPX0	MPX1	QSt	BE	Mono	P1	P2	Matrix

MPX0	MPX1	MPX-Period		Recommended $C_{13,14}$	Perm. Xtal Tolerances
0	0	2 s	Power-ON	1 µF	± 20 ppm
0	1	4 s		2.2 µF	± 10 ppm
1	0	8 s		4.7 µF	± 5 ppm
Settings specially recommended for crystal operation					
0	0	2 s		470 nF	± 40 ppm
0	1	4 s		330 nF	± 70 ppm

MXP-period = 2 s means that identification-signal decoder searches 1 s for dual and 1 s for stereo. It is basically permissible, for the given $C_{13,14}$, to make the MPX period longer, but not shorter.

QSt	=	0	Quasi-stereo OFF; power ON
QSt	=	1	Quasi-stereo ON
BE	=	0	Stereo base enlargement OFF; power ON
BE	=	1	Stereo base enlargement ON
Mono	=	0	Identification-signal decoder set to mono and held; power ON
Mono	=	1	Normal operation of identification-signal decoder
P1	=	0	Port 1 (open collector) low (low-impedance); power ON
P1	=	1	Port 1 high (high impedance)
P2	=	0	Port 2 (open collector) low (low-impedance); power ON
P2	=	1	Port 2 high (high impedance)
Matrix	=	0	Gain matrix 0 dB
Matrix	=	1	Gain matrix 6 dB; power ON

h) Talk Mode

MSB	•	•	•	•	•	•	LSB
St	D	T3	T4	T5	CL	X	X
0	0	Decoder detects mono					
1	0	Decoder detects stereo					
0	1	Decoder detects dual					
1	1	Suppressed internally					

CL = 1 Loudspeaker signal path at clipping limit
(CL is automatically reset after each reading operation)

T3 thru T5 are test bits.

Absolute Maximum Ratings

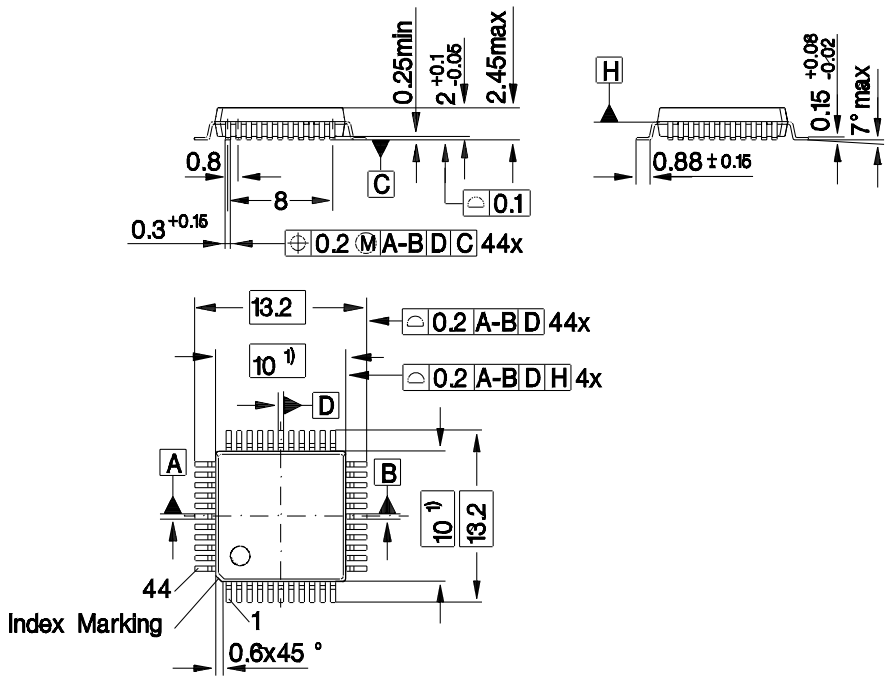
I²C Bus Timing Diagram

t_{SUSTA}	Setup time (start)
t_{HDSTA}	Hold time (start)
t_H	H-pulse width (clock)
t_L	L-pulse width (clock)
t_{SUDAT}	Setup time (data change)
t_{HDDAT}	Hold time (data change)
t_{SUSTO}	Setup time (stop)
t_{BUF}	Bus free time
t_F	Fall time
t_R	Rise time

All times referred to V_{IH} and V_{IL} values.

Package Outlines

Plastic-Package, P-MQFP-44-2 (SMD)
(Plastic Metric Quad Flat Package)



1) Does not include plastic or metal protrusion of 0.25 max. per side

GPM05622

Sorts of Packing
Package outlines for tubes, trays etc. are contained in our Data Book “Package Information”

SMD = Surface Mounted Device

Dimensions in mm
