

Processor Supervisory Circuits

■ Features

- Power-on reset generator with fixed delay time of 200ms (AP1705/6/7)
- Manual reset input (AP1705/7)
- Reset output available in active-Low (AP1705/6/7), active-high (AP1706/7)
- Supply voltage supervision range 2.5V, 3V, 3.3V, 5V
- Watchdog timer (AP1705/6/7)
- Supply current of 25 μ A (Typ.)
- SOT23-5, SOT23-6, TSOT23-5 and TSOT23-6 Pb-Free Package
- Temperature range: -40°C to 85°C

■ Applications

- Applications Using DSPs, Microcontrollers, or Microprocessors
- Industrial Equipment
- Programmable Controls
- Automotive Systems
- Portable/Battery-Powered Equipment
- Intelligent Instruments
- Wireless Communications Systems
- Notebook/Desktop Computers

AP1705/6/7

■ General Description

The AP1705/6/7 family of supervisors provides circuit initialization and timing supervision, primarily for DSP and processor-based systems.

During power-on, RESET is asserted when supply voltage V_{CC} becomes higher than 1.1V. Thereafter, the supply voltage supervisor monitors V_{CC} and keeps RESET active as long as V_{CC} remains below the threshold voltage V_{IT-} . An internal timer delays the return of the output to the inactive state (high) to ensure proper system reset. The delay time t_d , starts after V_{CC} has risen above the threshold voltage V_{IT-} . When the supply voltage drops below the threshold voltage V_{IT-} , the output becomes active (low) again. No external components are required. All the devices of this family have a fixed-sense threshold voltage V_{IT-} set by an internal voltage divider.

The AP1705/7 devices incorporate a manual reset input, MR. A low level at MR causes RESET to become active. The AP1706/7 devices include a high-level output RESET. AP1705/6/7 have a watchdog timer that is periodically triggered by a positive or negative transition at WDI. When the supervising system fails to retrigger the watchdog circuit within the time-out interval, t_{tout} , RESET becomes active for the time period t_d . This event also reinitializes the watchdog timer. Leaving WDI unconnected disables the watchdog.

In applications where the input to the WDI pin may be active (transitioning high and low) when the AP1705/6/7

asserting RESET, the AP1705/6/7 does not return to a non-reset state when the input voltage is above V_t . If the application requires that input to WDI is active when

RESET is asserted, WDI must be decoupled from the active signal. This can be accomplished by using an N-channel FET in series with the WDI pin, with the gate of the FET connected to the RESET output as shown in Figure 1.

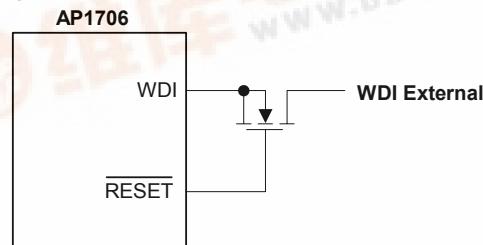

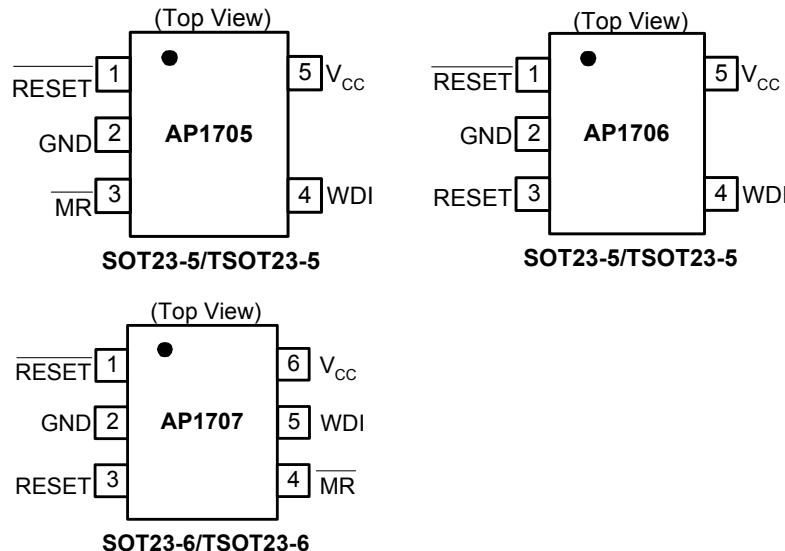

Figure 1.

The product spectrum is designed for supply voltage of 2.5V, 3V, 3.3V and 5V. The circuits are available in a SOT23-5L, SOT23-6L, and TSOT23-5L, TSOT23-6L packages. The AP1705/6/7 devices are characterized for operation over a temperature range of -40°C to 85°C.

■ Pin Assignments

■ Pin Descriptions

Name	Description
GND	Ground
RESET (RESET)	Reset output pin
V _{CC}	Operating voltage input
WDI	Watchdog input
MR	Manual reset

■ Absolute Maximum Ratings

(Over operating free-air temperature range, unless otherwise noted)*

Symbol	Parameter	Rating	Unit	
V _{CC}	Supply Voltage (see note 1)	6.5	V	
	RESET, RESET, MR, WDI (see note 1)	-0.3 to (V _{CC} +0.3)	V	
I _{OL}	Maximum Low Output Current	5	mA	
I _{OH}	Maximum High Output Current	-5	mA	
I _{IK}	Input Clamp Current Range(V _I < 0 or V _I > V _{CC})	±10	mA	
I _{OK}	Output Clamp Current Range(V _O < 0 or V _O > V _{CC})	±10	mA	
P _D	Continuous Total Power Dissipation	Operating Factor Above T _A = 25°C	mW/°C	
		T _A ≤ 25°C Power Rating	437	mW
		T _A = 70°C Power Rating	280	mW
		T _A = 85°C Power Rating	227	mW
T _A	Operating Free-air Temperature Range	-40 to 85	°C	
T _{STG}	Storage Temperature Range	-65 to 150	°C	
T	Soldering Temperature	260	°C	

* Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Note 1: All voltage values are with respect to GND.
