

AME, Inc.

AME8833/8834

■ General Description

The AME8833 family of positive, linear regulators feature low quiescent current (50 μ A typ.) low dropout voltage and excellent PSRR, thus making them ideal for Telecommunications and other battery applications. The ultra-small SC-70 package is attractive for "Pocket" and "Hand Held" applications.

AME8834's output voltage can be adjusted with an external resistor divider.

These rugged devices have both Thermal Shutdown, and Current Fold-back to prevent device failure under the "Worst" of operating conditions.

As an additional feature, the AME8833/8834 is stable with an output capacitance of just extended 0.22 μ F or greater.

■ Features

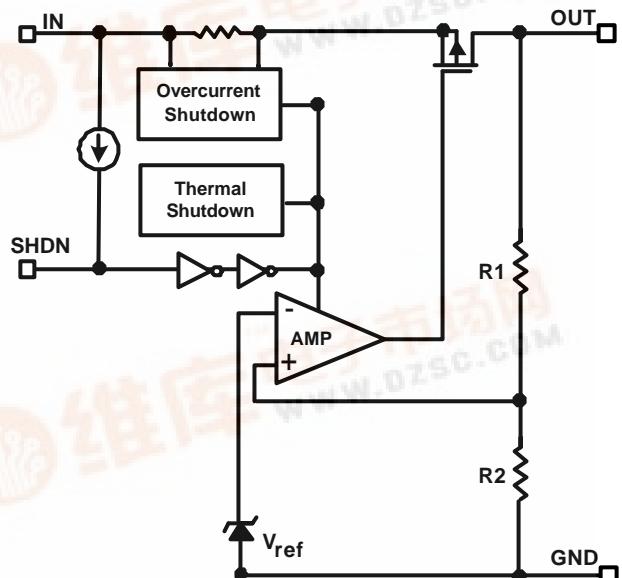

- Stable with only 0.22 μ F output Cap
- Very Low Dropout Voltage
- Guaranteed 150mA Output
- Accurate to within 1.0%
- 50 μ A Quiescent Current
- Over-Temperature Shutdown
- Current Limiting
- Short Circuit Current Fold-back
- Excellent PSRR (Typ. 70dB)
- Power-Saving Shutdown Mode
- Ultra-small SC-70 and TSOT-25 Package
- Factory Pre-set Output Voltages
- Low Temperature Coefficient
- Input Voltage Range (2V - 5.5V)

■ Applications

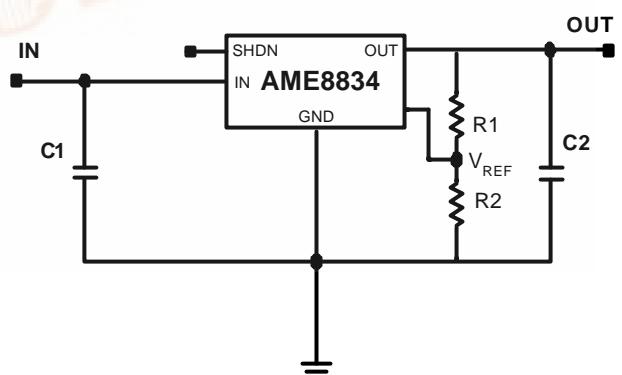

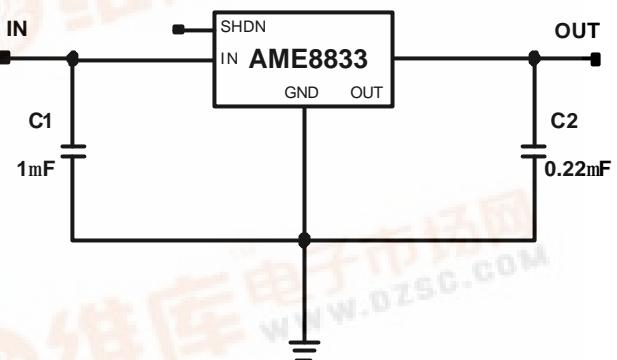

- Cellular Phones
- Instrumentation
- Portable Electronics
- Wireless Devices
- Cordless Phones
- PC Peripherals
- Battery Powered Widgets
- Electronic Scales
- Cameras
- Telecommunications

AME8833/8834

High PSRR, 150mA CMOS LDO

■ Detailed Description

The AME8833/8834 family of CMOS regulators contain a PMOS pass transistor, voltage reference, error amplifier, over-current protection, and thermal shutdown.

The P-channel pass transistor receives data from the error amplifier, over-current shutdown, and thermal protection circuits. During normal operation, the error amplifier compares the output voltage to a precision reference. Over-current and Thermal shutdown circuits become active when the junction temperature exceeds 150°C, or the current exceeds 150mA. During thermal shutdown, the output voltage remains low. Normal operation is restored when the junction temperature drops below 120°C.

The AME8833/8834 switches from voltage mode to current mode when the load exceeds the rated output current. This prevents over-stress. The AME8833/8834 also incorporates current foldback to reduce power dissipation when the output is short circuited. This feature becomes active when the output drops below 0.8volts, and reduces the current flow by 65%. Full current is restored when the voltage exceeds 0.8 volts.

■ Shutdown

When actively, pulled low, the PMOS pass transistor shuts off, and all internal circuits are powered down. In this state, the quiescent current is less than 1µA. This pin behaves much like an electronic switch.

■ Adjustable Version

AME8834 features a user-adjustable output through an external feedback resistor divider. To set the output of AME8834 use the following equation:

$$V_{OUT} = V_{ADJ}(1 + R1/R2)$$
$$V_{ADJ} = 1.225V, \text{ use 1% or better resistors}$$

■ External Capacitors

The AME8833/8834 is stable with an output capacitor to ground of 0.22µF or greater. Ceramic capacitors have the lowest ESR, and will offer the best AC performance. Conversely, Aluminum Electrolytic capacitors exhibit the highest ESR, resulting in the poorest AC response.

A second capacitor is recommended between the input and ground to stabilize Vin. The input capacitor should be at least 1µF to have a beneficial effect.

A larger capacitor improves the AC ripple rejection, but also makes the output come up slowly. This "Soft" turn-on is desirable in some applications to limit turn-on surges.

All capacitors should be placed in close proximity to the pins. A "Quiet" ground termination is desirable. This can be achieved with a "Star" connection.
