

# Open-Drain Microprocessor Supervisory Circuit in 4-Lead SOT-143

## ADM6315

### FEATURES

- Specified over Temperature
- Low Power Consumption (5  $\mu$ A Typ)
- Precision Voltage Monitor of Voltages from 2.5 V to 5 V at 100 mV Increments
- Reset Assertion Down to  $V_{CC} > 1$  V
- Reset Timeout Periods: 1 ms, 20 ms, 140 ms, or 1120 ms (Min)
- Built-In Manual Reset
- Pin Compatible with the ADM811
- Available in SOT-143 Package

### APPLICATIONS

- Microprocessor Systems
- Controllers
- Intelligent Instruments
- Automotive Systems
- Safety Systems
- Portable Instruments

### GENERAL DESCRIPTION

The ADM6315 is a reliable voltage monitoring device that is suitable for use in most voltage monitoring applications.

The ADM6315 is designed to monitor as little as a 1.8% degradation of a power supply voltage. Voltages that can be monitored by the ADM6315 are all voltages (at 100 mV increments) from 2.5 V to 5 V.

Included in this circuit is a debounced manual reset input.  $\overline{\text{RESET}}$  can be activated using an ordinary switch (pulling  $\overline{\text{MR}}$  low), a low input from another digital device, or a degradation of the supply voltage. The manual reset function is very useful, especially if the circuit in which the ADM6315 is operating enters into a state that can be detected only by the user. Allowing the user to manually reset a system can reduce the damage or danger that could otherwise be caused by an out-of-control or locked-up system.

The ADM6315 comes in a cost and space efficient SOT-143 package.

## ABSOLUTE MAXIMUM RATINGS\*

( $T_A = 25^\circ\text{C}$ , unless otherwise noted.)

### Terminal Voltage (With Respect to Ground)

$V_{CC}$  ..... -0.3 V to +6 V  
 All Other Inputs ..... -0.3 V to +6 V

### Input Current

$V_{CC}$  ..... 20 mA

### Output Current

$\overline{\text{RESET}}$  ..... 20 mA

### Power Dissipation ( $T_A = 70^\circ\text{C}$ )

RA-4, SOT-143

Derate by 4 mW/ $^\circ\text{C}$  above  $70^\circ\text{C}$  ..... 320 mW

$\theta_{JA}$  Thermal Impedance .....  $330^\circ\text{C}/\text{W}$

Operating Temperature Range .....  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$

Storage Temperature Range .....  $-65^\circ\text{C}$  to  $+160^\circ\text{C}$

Lead Temperature (Soldering, 10 sec) .....  $300^\circ\text{C}$

Vapor Phase (60 sec) .....  $215^\circ\text{C}$

Infrared (15 sec) .....  $220^\circ\text{C}$

ESD Rating ..... 2.5 kV

\*Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability.

## PIN CONFIGURATION

## PIN FUNCTION DESCRIPTIONS

Pin	Mnemonic	Function
1	GND	0 V. Ground reference for all signals.
2	$\overline{\text{RESET}}$	Active Low Logic Output. $\overline{\text{RESET}}$ remains low while $V_{CC}$ is below the reset threshold or when $\overline{\text{MR}}$ is low; $\overline{\text{RESET}}$ then remains low for either 1 ms (min), 20 ms (min), 140 ms (min), or 1120 ms (min) after $V_{CC}$ rises above the reset threshold and $\overline{\text{MR}}$ is high.
3	$\overline{\text{MR}}$	Manual Reset. This active low debounced input will ignore input pulses of 100 ns (typical) and is guaranteed to accept input pulses of greater than 1 $\mu\text{s}$ . Leave floating when not used.
4	$V_{CC}$	Monitored Supply Voltage.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADM6315 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## INTERFACING TO OTHER DEVICES' OUTPUT

The ADM6315 series is designed to integrate with as many devices as possible. One feature of the ADM6315 is the  $\overline{\text{RESET}}$  open-drain output, which can sink current from sources with a voltage greater than the  $V_{CC}$  of the ADM6315 input, making it suitable for use in more diverse applications.

## BENEFITS OF A VERY ACCURATE RESET THRESHOLD

Because the ADM6315 series can operate effectively even when there are large degradations of the supply voltages (due to an accurate internal voltage reference circuit), the possibility of a malfunction during a power failure is greatly reduced.

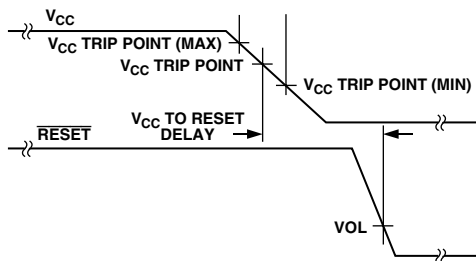

Figure 2.  $V_{CC}$  Power-Down/Brownout Timing Diagram

## DETAILED DESCRIPTION

The ADM6315 is designed to protect the integrity of a system's operation by ensuring the proper operation of the system during power-up, power-down, and brownout conditions.

When the ADM6315 is powered up (depending on the selected reset active timeout), the  $\overline{\text{RESET}}$  output of the ADM6315 remains low for a period typically equal to the reset active timeout period. This is designed to give the system time to power up correctly and for the power supply to stabilize before any devices are brought out of reset and allowed to begin executing instructions. Initializing a system in this way provides a more reliable startup for microprocessor systems.

When a brownout condition occurs (assuming  $V_{CC}$  is falling at  $1 \text{ mV}/\mu\text{s}$ ), the ADM6315 produces a reset in typically  $35 \mu\text{s}$ . Producing a reset this fast means that the entire system can be reset together before any part of the system's voltage falls below its recommended operating voltage. This can avoid dangerous and/or erroneous operation of a microprocessor based system.

## MANUAL RESET INPUT

The ADM6315 also provides an additional input,  $\overline{\text{MR}}$ . This input can be used either as a means for the system operator to manually reset the system via a switch or for a digital circuit to reset the system.

The  $\overline{\text{MR}}$  input (typically) ignores negative going pulses faster than  $100 \text{ ns}$  and is guaranteed to accept any negative going input pulse of a duration greater than or equal to  $1 \mu\text{s}$ . If  $\overline{\text{MR}}$  is connected to long cables or is used in a noisy environment, then placing a  $1 \mu\text{F}$  decoupling capacitor between the  $\overline{\text{MR}}$  input and ground further improves the glitch immunity of the ADM6315.

Figure 3.  $V_{CC}$  Power-Up Timing Diagram

## TRANSIENT IMMUNITY

As well as being an accurate reset circuit, the ADM6315 has good immunity to negative going transients (TPC 4). Because of this characteristic, the ADM6315 is suitable for use in noisy environments.

TPC 4 shows the reset comparator overdrive (the maximum magnitude of negative going pulses with respect to the typical reset threshold) versus the pulse duration, without causing a reset.
