

LT1796

Overvoltage Fault Protected CAN Transceiver

FEATURES

- Protected from Overvoltage Line Faults to $\pm 60V$
- ESD Protection to IEC-1000-4-2 Level 4
 $\pm 15kV$ Air Gap Test
 $\pm 8kV$ Contact Mode Test
- ISO 11898 Compatible
- High Input Impedance Supports Up to 256 Nodes
- Controlled Slew Rates for EMI Emissions Control
- High Impedance Outputs When Off or Powered Down
- Short-Circuit Protection On All Outputs
- Thermal Shutdown Protection
- Pin Compatible with Philips PCA82C251

APPLICATIONS

- Industrial Control Data Networks
- Automotive Systems
- HVAC Controls

DESCRIPTION

The LT[®]1796 CAN transceiver provides built-in fault tolerance to survive in industrial and automotive environments. Discrete protection devices are not needed. Bus interface pins can withstand voltage faults up to $\pm 60V$ with respect to ground with no damage to the device. Faults may occur while the transceiver is active, shut down or powered off. On-chip ESD protection withstands up to $\pm 15kV$ air discharges and $\pm 8kV$ contact mode discharges tested per IEC-1000-4-2. Loss of power or ground connections does not damage the IC.

The circuit operates with data rates up to 125kbaud. A slew control pin allows control of transmitted data pulse edges to control EMI and reflection problems on imperfectly terminated lines. High output current drive allows the use of inexpensive PVC cable with impedance as low as 72Ω . The $100k\Omega$ input impedance allows up to 256 transceivers per data network.

The LT1796 is available in 8-lead PDIP and SO packages.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 2: Unless otherwise specified, testing done at $V_{CC} = 5\text{V}$, $T_A = 25^\circ\text{C}$.

Note 3: Bit time and data rate specifications are guaranteed by driver and receiver delay time measurements.

1796 G11

PIN FUNCTIONS

TXD (Pin 1): Driver Input. Logic-level thresholds are set by V_{REF} . A logic input level higher than V_{REF} turns the driver outputs off, releasing control of the CANH and CANL lines. A logic input less than V_{REF} turns the driver outputs on, pulling CANH high and CANL low. An open TXD input will float high, turning the driver outputs off. The TXD input pin can withstand voltages from $-0.3V$ to $44V$ with no damage.

GND (Pin 2): Ground.

V_{CC} (Pin 3): Positive Supply Input. Normal operation is with a $4.75V$ to $5.25V$ supply. Operation with supplies up to $44V$ is possible with unterminated bus lines. Operation at high voltages with normally terminated busses will result in excessive power dissipation and activation of the thermal shutdown circuit. V_{CC} should be decoupled with a $0.1\mu F$ low ESR capacitor placed as close to the supply pin as possible.

RXD (Pin 4): Receiver TTL Level-Logic Output. A high level output indicates a recessive state (zero-volt differential) bus. A dominant state forces a low receiver output.

V_{REF} (Pin 5): Reference Output. The reference voltage sets the TXD input threshold and the recessive bus common mode voltage at CANH and CANL. V_{REF} is approximately $V_{CC}/2$ for low voltage operation. When $V_{CC} > 7.5V$, V_{REF} maintains a $3.5V$ level.

CANL (Pin 6): CAN Bus Low Data Line. The CANL pin is one input to the receiver and the low driver output. In the dominant state (TXD low), the driver pulls the CANL pin to within $1V$ of GND. In the recessive state (TXD high), the driver output stays high impedance. The CANL pin is protected from voltage faults from $-60V$ to $60V$ in dominant, recessive, standby or powered off modes. On-chip ESD protection meets IEC-1000-4-2 levels.

CANH (Pin 7): CAN Bus High Data Line. The CANH pin is one input to the receiver and the high driver output. In the dominant state (TXD low), the driver pulls the CANH pin to within $1V$ of V_{CC} . In the recessive state (TXD high), the driver output stays high impedance. The CANH pin is protected from voltage faults from $-60V$ to $60V$ in dominant, recessive, standby or powered off modes. On-chip ESD protection meets IEC-1000-4-2 levels.

R_S (Pin 8): Slope Control. This pin is a multifunction control pin. When R_S is high ($V_{RS} > 4V$), the circuit goes into a low power standby mode. In standby, the driver always stays in a high impedance (recessive) state. The receiver operates in a low power (slow) monitoring mode. Received data may be used to “wake-up” the system to full functionality. Full speed normal operation occurs if R_S is tied low through a resistance of less than $3k$. The current out of R_S will be limited to about $500\mu A$ in the low state. Controlling the current out of R_S with a resistor greater than $3k$ or by using a current source allows slew rate control of the data output onto CANH and CANL.

FUNCTION TABLES

Driver Output

INPUTS		BUS TERMINALS		OPERATING STATE
TXD	RS	CANH	CANL	
0	$V_{RS} < 3V$	High	Low	Dominant
0	$V_{RS} > 4V$	Hi-Z	Hi-Z	Standby
1	$V_{RS} < 3V$	Hi-Z	Hi-Z	Recessive
1	$V_{RS} > 4V$	Hi-Z	Hi-Z	Standby

Receiver Output

BUS VOLTAGE $V_{BUS} = V_{CANH} - V_{CANL}$	RS	RXD	RESPONSE TIME
$V_{BUS} < 0.5V$	$< 3V$	High	Fast
$0.5V \leq V_{BUS} \leq 0.9V$	$< 3V$	Indeterminate	Fast
$V_{BUS} > 0.9V$	$< 3V$	Low	Fast
$V_{BUS} < 0.5V$	$> 4V$	High	Slow
$0.5V \leq V_{BUS} \leq 0.9V$	$> 4V$	Indeterminate	Slow
$V_{BUS} > 0.9V$	$> 4V$	Low	Slow

PACKAGE DESCRIPTION

N8 Package 8-Lead PDIP (Narrow .300 Inch) (Reference LTC DWG # 05-08-1510)

NOTE:
1. DIMENSIONS ARE $\frac{\text{INCHES}}{\text{MILLIMETERS}}$
*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH (0.254mm)

S8 Package 8-Lead Plastic Small Outline (Narrow .150 Inch) (Reference LTC DWG # 05-08-1610)

NOTE:
1. DIMENSIONS IN $\frac{\text{INCHES}}{\text{MILLIMETERS}}$
2. DRAWING NOT TO SCALE
3. THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .006" (0.15mm)
