

Low-Cost, 2.7V to 5.5V, Analog Temperature Sensor Switches in a SOT23

General Description

The MAX6516–MAX6519 low-cost, fully integrated temperature switches assert a logic signal when their die temperature crosses a factory-programmed threshold. Operating from a 2.7V to 5.5V supply, these devices feature a fixed voltage reference, an analog temperature sensor, and a comparator. They are available with factory-trimmed temperature trip thresholds from -45°C to $+115^{\circ}\text{C}$ in 10°C increments, and are accurate to $\pm 0.5^{\circ}\text{C}$ (typ). These devices require no external components and typically consume $22\mu\text{A}$ of supply current. Hysteresis is pin selectable at 2°C or 10°C .

The MAX6516–MAX6519 are offered with hot-temperature thresholds ($+35^{\circ}\text{C}$ to $+115^{\circ}\text{C}$), asserting when the temperature is above the threshold, or with cold-temperature thresholds (-45°C to $+15^{\circ}\text{C}$), asserting when the temperature is below the threshold.

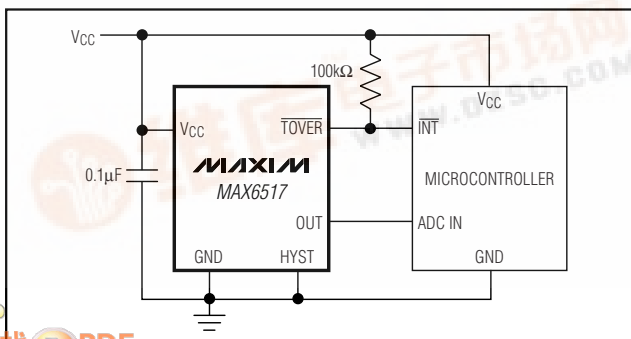

These devices provide an analog output proportional to temperature and are stable with any capacitive load up to 1000pF . The MAX6516–MAX6519 can be used over a range of -35°C to $+125^{\circ}\text{C}$ with a supply voltage of 2.7V to 5.5V. For applications sensing temperature down to -45°C , a supply voltage above 4.5V is required.

The MAX6516 and MAX6518 have an active-high, push-pull output. The MAX6517 and MAX6519 have an active-low, open-drain output. These devices are available in a space-saving 5-pin SOT23 package and operate over the -55°C to $+125^{\circ}\text{C}$ temperature range.

Applications

Fan Control	Over/Undertemperature Protection
Test Equipment	Notebook, Desktop PCs
Temperature Control	RAID
Temperature Alarms	Servers

Typical Operating Circuit

Features

- ◆ High Accuracy $\pm 1.5^{\circ}\text{C}$ (max) Over -15°C to $+65^{\circ}\text{C}$ Temperature Range
- ◆ Low Power Consumption— $22\mu\text{A}$ Typical Current
- ◆ Factory-Programmed Thresholds from -45°C to $+115^{\circ}\text{C}$ in 10°C Increments
- ◆ Analog Output to Allow Board-Level Testing
- ◆ Open-Drain or Push-Pull Outputs
- ◆ Pin-Selectable 2°C or 10°C Hysteresis
- ◆ Low Cost

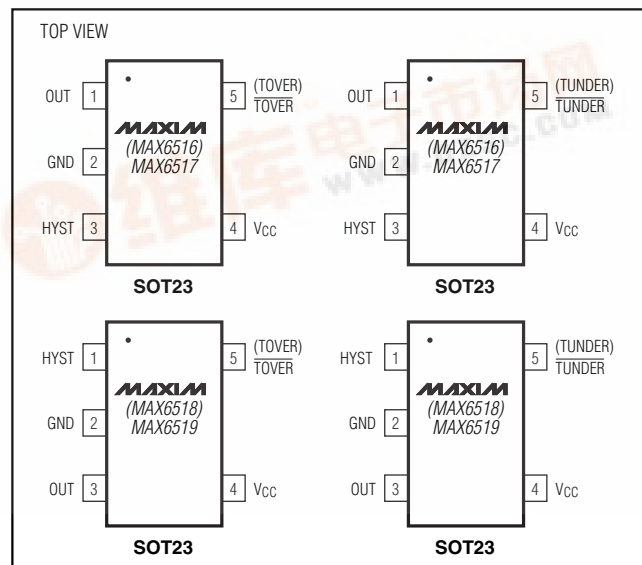

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX6516UK____-T	-55°C to $+125^{\circ}\text{C}$	5 SOT23-5
MAX6517UK____-T	-55°C to $+125^{\circ}\text{C}$	5 SOT23-5
MAX6518UK____-T	-55°C to $+125^{\circ}\text{C}$	5 SOT23-5
MAX6519UK____-T	-55°C to $+125^{\circ}\text{C}$	5 SOT23-5

*These parts are offered in 16 standard temperature versions with a minimum order of 2500 pieces. To complete the suffix information, add P or N for positive or negative trip temperature, and select an available trip point in degrees centigrade. For example, the MAX6516UKP065-T describes a MAX6516 in a 5-pin SOT23 package with a $+65^{\circ}\text{C}$ threshold. Contact the factory for pricing and availability.

Functional Diagram appears at end of data sheet.

Pin Configurations

Low-Cost, 2.7V to 5.5V, Analog Temperature Sensor Switches in a SOT23

ABSOLUTE MAXIMUM RATINGS

All voltages are referenced to GND.

V_{CC}	-0.3V to +6V
TOVER, TUNDER (open drain)	-0.3V to +6V
TOVER, TUNDER (push-pull)	-0.3V to ($V_{CC} + 0.3V$)
OUT, HYST	-0.3V to ($V_{CC} + 0.3V$)
OUT Short to GND	Indefinite

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)

5-Pin SOT23 (derate 7.1mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$).....571mW

Operating Temperature Range

Junction Temperature

Storage Temperature Range

Lead Temperature (soldering, 10s)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_{CC} = 2.7V$ to $5.5V$, $R_{PULLUP} = 100k\Omega$ (open-drain output only), $T_A = -55^\circ\text{C}$ to $+125^\circ\text{C}$, unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Supply Voltage Range	V_{CC}		2.7		5.5	V
Supply Current	I_{CC}	Hot-temperature thresholds ($+35^\circ\text{C}$ to $+115^\circ\text{C}$)		22	40	μA
		Cold-temperature thresholds (-45°C to $+15^\circ\text{C}$)		40		
Temperature Threshold Accuracy (Note 2)	ΔT_{TH}	-15°C to $+65^\circ\text{C}$	-1.5		+1.5	$^\circ\text{C}$

Typical Operating Characteristics (continued)

(V_{CC} = 5V, T_A = +25°C, unless otherwise noted.)

Pin Description

PIN				NAME	FUNCTION
MAX6516	MAX6517	MAX6518	MAX6519		
1	1	3	3	OUT	Analog Output. Voltage represents the die's temperature.
2	2	2	2	GND	Ground
3	3	1	1	HYST	Hysteresis Input. Connect to V _{CC} for 2°C of hysteresis or to GND for 10°C hysteresis.
4	4	4	4	V _{CC}	Input Supply. Bypass to ground with a 0.1µF capacitor.
5	—	5	—	TOVER	Push-Pull Active-High Output (Hot Threshold). TOVER goes high when the die temperature exceeds the factory-programmed hot temperature threshold.
—	5	—	5	TOVER	Open-Drain, Active-Low Output (Hot Threshold). TOVER goes low when the die temperature exceeds the factory-programmed hot temperature threshold. Connect to a 100kΩ pullup resistor. May be pulled up to a voltage higher than V _{CC} .
5	—	5	—	TUNDER	Push-Pull Active-High Output (Cold Threshold). TUNDER goes high when the die temperature falls below the factory-programmed cold temperature threshold.
—	5	—	5	TUNDER	Open-Drain, Active-Low Output (Cold Threshold). TUNDER goes low when the die temperature goes below the factory-programmed cold temperature threshold. Connect to a 100kΩ pullup resistor. May be pulled up to a voltage higher than V _{CC} .

Low-Cost, 2.7V to 5.5V, Analog Temperature Sensor Switches in a SOT23

Detailed Description

The MAX6516–MAX6519 fully integrated temperature switches incorporate a fixed reference, an analog temperature sensor, and a comparator. The temperature at which the two reference voltages are equal determines the temperature trip point. OUT is an analog voltage that varies with the die's temperature. Pin-selectable 2°C or 10°C hysteresis keeps the digital output from oscillating when the die temperature approaches the threshold temperature. The MAX6516 and MAX6518 have an active-high, push-pull output structure that can sink or source current. The MAX6517 and MAX6519 have an active-low, open-drain output structure that can only sink current. The internal power-on reset circuit guarantees the logic output is at its +25°C state for at least 50μs.

Analog Output

OUT is an analog output that is proportional to the die temperature. OUT voltage range is between 0.77V to 2.59V, within the temperature range of -45°C to +125°C. For applications with a switching threshold of -45°C, the supply voltage must be greater than 4.5V. The temperature-to-voltage transfer function is approximately linear and can be described by the quadratic equation:

$$V_{OUT} = 1.8015 - 10.62\text{mV} (T - 30) + 1.1\mu\text{V} (T - 30)^2$$

where T = temperature in °C.

In most cases, a linear approximation can be applied:

$$V_{OUT} = 1.8015 - 10.62\text{mV} (T - 30)$$

Therefore,

$$T = \frac{1.8015 - V_{OUT}}{0.01062} + 30^\circ\text{C}$$

Hysteresis Input

The HYST input selects the devices' temperature hysteresis and prevents the output from oscillating when the temperature approaches the trip point. Connect HYST to VCC for 2°C hysteresis or to GND for 10°C hysteresis.

Logic Temperature Indicators

Overtemperature Indicator (Hot Thresholds)

TOVER and $\overline{\text{TOVER}}$ designations apply to thresholds above $T_A = +25^\circ\text{C}$ (+35°C, +45°C, +55°C, +65°C, +75°C, +85°C, +95°C, +105°C, +115°C). All "hot" thresholds are positive temperatures.

The overtemperature indicator output is open-drain active low ($\overline{\text{TOVER}}$) or push-pull active high (TOVER). $\overline{\text{TOVER}}$ goes low when the die temperature exceeds the factory-programmed temperature threshold. $\overline{\text{TOVER}}$ should be pulled up to a voltage no greater than 5.5V with a 100kΩ pullup resistor. TOVER is a push-pull active-high CMOS output that goes high when the die temperature exceeds the factory-programmed temperature threshold.

Undertemperature Indicator (Cold Thresholds)

TUNDER and $\overline{\text{TUNDER}}$ designations apply to thresholds below $T_A = +25^\circ\text{C}$ (+15°C, +5°C, -5°C, -15°C, -25°C, -35°C, -45°C). The undertemperature indicator output is open drain, active low ($\overline{\text{TUNDER}}$), or push-pull active high (TUNDER). $\overline{\text{TUNDER}}$ goes low when the die temperature goes below the factory-programmed temperature threshold. $\overline{\text{TUNDER}}$ should be pulled up to a voltage no greater than 5.5V with a 100kΩ pullup resistor. TUNDER is a push-pull active-high CMOS output that goes high when the die temperature falls below the factory-programmed temperature threshold.

Applications Information

Temperature-Window Alarm

The MAX6516/MAX6518 logic outputs assert when the die temperature is outside the factory-programmed range. Combining the outputs of two devices creates an over/undertemperature alarm. Two MAX6516s or two MAX6518s are used to form two complementary pairs, containing one cold trip-point output and one hot trip-point output. The assertion of either output alerts the system to an out-of-range temperature. The MAX6516 push-pull output stages can be ORed to produce a thermal out-of-range alarm (Figure 1).

More favorably, two MAX6517s or two MAX6519s can be directly wire-ORed with a single external resistor to accomplish the same task. The temperature window alarms shown in Figure 2 can be used to accurately determine when a device's temperature falls out of the -5°C to +75°C range. The thermal overrange signal can be used to assert a thermal shutdown, power-up, recalibration, or other temperature-dependent function.

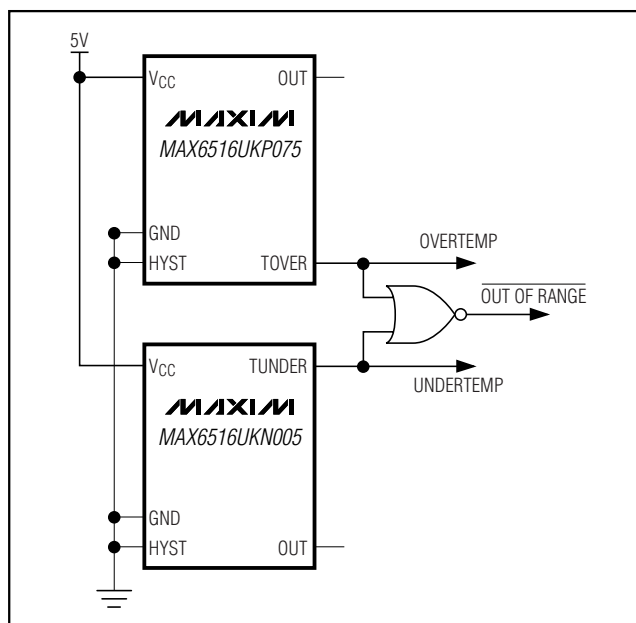

Figure 1. Temperature-Window Alarms Using the MAX6516

Low-Cost, Fail-Safe Temperature

In high-performance/high-reliability applications, multiple temperature monitoring is important. The high-level integration and low cost of the MAX6516 and MAX6518 facilitate the use of multiple temperature monitors to increase system reliability. The application in Figure 3 uses two MAX6516s with different hot temperature thresholds to ensure that fault conditions that can overheat the monitored device cause no permanent damage. The first temperature monitor activates the fan when the die temperature exceeds +45°C. The second MAX6516 triggers a system shutdown if the die temperature reaches +75°C, preventing damage from a wide variety of destructive fault conditions, including latchups, short circuits, and cooling-system failures.

PC Board Testing

The MAX6516–MAX6519 temp sensor devices can be tested after PC board assembly using OUT. Testing can be used to verify proper assembly and functionality of the temperature protection circuitry. Since OUT has a weak drive capability, the voltage at OUT can be forced to cause the digital outputs to change states, thereby verifying that the internal comparators and output circuitry function properly after assembly. Below is a test procedure that can be used to test the MAX6516–MAX6519:

- Power up the device, measure OUT, and observe the state of the logic output.

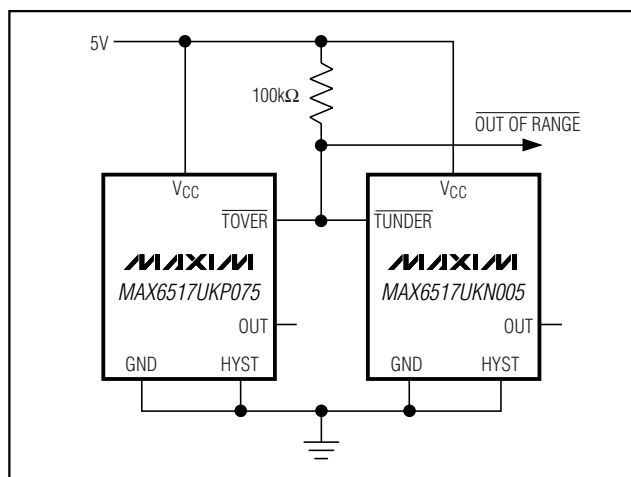

Figure 2. Temperature Window Alarm Using the MAX6517

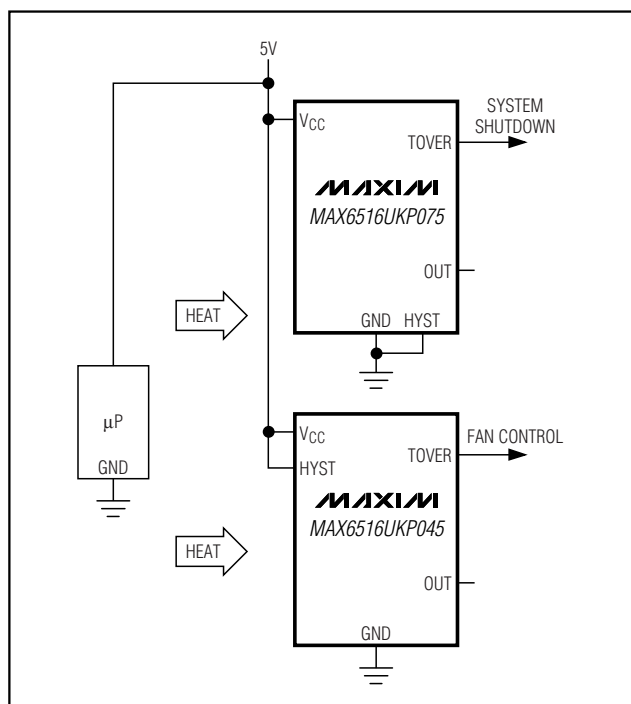

Figure 3. Low-Power, High-Reliability, Fail-Safe Temperature Monitor

Low-Cost, 2.7V to 5.5V, Analog Temperature Sensor Switches in a SOT23

- Calculate the temperature using the formula:

$$T = \frac{1.8015 - V_{OUT}}{0.01062} + 30$$

- Verify that the temperature measured is within $\pm 2^\circ\text{C}$ of the ambient board temperature. Measure the ambient board temperature using an accurate calibrated temperature sensor.
- Connect OUT to ground (OUT to V_{CC} for cold threshold versions) and observe the state change of the logic output.
- Disconnect OUT from ground and observe that the logic output reverts to its initial state.

Hysteresis Testing

The MAX6516-MAX6519 can be programmed with 2°C or 10°C of hysteresis by pin strapping HYST to V_{CC} or GND, respectively. Below is a test feature that can be used to measure the accuracy of the device's hysteresis using a device with a $+65^\circ\text{C}$ threshold:

- Power up the device and observe the state of the digital output.
- Drive the OUT voltage down gradually.
- When the digital output changes state, note V_{OUT} .
- $V_{OUTtrip} = V_{OUT}$ at logic output change of state (high to low or low to high).
- Calculate trip temperature (T_1) using:

$$T = \frac{1.8015 - V_{OUT}}{0.01062} + 30$$

- Gradually raise V_{OUT} until the digital output reverts to its initial state and note V_{OUT} .
- Calculate trip temperature (T_2).
- $T_{HYST} = T_2 - T_1$.

Thermal Considerations

The MAX6516-MAX6519 supply current is typically $22\mu\text{A}$. When used to drive high-impedance loads, the devices dissipate negligible power. Therefore, the die temperature is essentially the same as the package temperature.

Accurate temperature monitoring depends on the thermal resistance between the device being monitored and the MAX6516-MAX6519 die. Heat flows in and out of plastic packages, primarily through the leads. Pin 2 of the 5-pin SOT23 package provides the lowest thermal resistance to the die. Short, wide copper traces between the MAX6516-MAX6519 and the object whose temperature is being monitored ensures heat transfers occur quickly and reliably. The rise in die temperature due to self-heating is given by the following formula:

$$\Delta T_J = P_{DISSIPATION} \times \theta_{JA}$$

where $P_{DISSIPATION}$ is the power dissipated by the MAX6516-MAX6519, and θ_{JA} is the thermal resistance of the package.

The typical thermal resistance is $+140^\circ\text{C}/\text{W}$ for the 5-pin SOT23 package. To limit the effects of self-heating, minimize the output current. For example, if the MAX6516-MAX6519 sink 1mA , the open-drain output voltage is guaranteed to be less than 0.3V . Therefore, an additional 0.3mW of power is dissipated within the IC. This corresponds to a 0.042°C shift in the die temperature in the 5-pin SOT23 package.
