

±15kV ESD-Protected, 1µA, 3.0V to 5.5V, 250kbps, RS-232 Transceivers with AutoShutdown

General Description

The MAX3221E/MAX3223E/MAX3243E are 3V-powered EIA/TIA-232 and V.28/V.24 communications interfaces with automatic shutdown/wakeup features, high data-rate capabilities, and enhanced electrostatic discharge (ESD) protection. All transmitter outputs and receiver inputs are protected to ±15kV using IEC 1000-4-2 Air-Gap Discharge, to ±8kV using IEC 1000-4-2 Contact Discharge, and to ±15kV using the Human Body Model.

The MAX3221E/MAX3223E/MAX3243E achieve a 1µA supply current with Maxim's revolutionary AutoShutdown™ feature. They save power without changes to the existing BIOS or operating system by entering low-power shutdown mode when the RS-232 cable is disconnected, or when the transmitters of the connected peripherals are off.

The transceivers have a proprietary low-dropout transmitter output stage, delivering true RS-232 performance from a +3.0V to +5.5V supply with a dual charge pump. The charge pump requires only four small 0.1µF capacitors for operation from a +3.3V supply. Each device is guaranteed to run at data rates of 250kbps while maintaining RS-232 output levels.

The MAX3221E contains just one driver and one receiver, making it the smallest single-supply RS-232 transceiver. The MAX3223E has two drivers and two receivers. The MAX3243E is a complete 3-driver/5-receiver serial port ideal for notebook or subnotebook computers. It also includes two noninverting receiver outputs that are always active, allowing external devices to be monitored without forward biasing the protection diodes in circuitry that may be powered down.

The MAX3221E, MAX3223E, and MAX3243E are available in space-saving TQFN, SSOP, and TSSOP packages.

Applications

Notebook, Subnotebook, and Palmtop Computers
Cellular Phones
Battery-Powered Equipment
Handheld Equipment
Peripherals
Printers

Pin Configurations appear at end of data sheet.

Typical Operating Circuits appear at end of data sheet.

Next Generation Device Features

- ◆ **For Space-Constrained Applications:**
MAX3228E/MAX3229E: ±15kV ESD-Protected, +2.5V to +5.5V RS-232 Transceivers in UCSP™
MAX3222E/MAX3232E/MAX3237E/MAX3241E/
MAX3246E: ±15kV ESD-Protected Down to 10nA, +3.0V to +5.5V, Up to 1Mbps, True RS-232 Transceivers (MAX3246E Available in a UCSP Package)
- ◆ **For Data Cable Applications:**
MAX3380E/MAX3381E: +2.35V to +5.5V, 1µA, 2Tx/2Rx RS-232 Transceivers with ±15kV ESD-Protected I/O and Logic Pins

Detailed Description

Dual Charge-Pump Voltage Converter

The MAX3221E/MAX3223E/MAX3243E's internal power supply consists of a regulated dual charge pump that provides output voltages of +5.5V (doubling charge pump) and -5.5V (inverting charge pump), over the +3.0V to +5.5V V_{CC} range. The charge pumps operate in discontinuous mode: if the output voltages are less than 5.5V, the charge pumps are enabled; if the output voltages exceed 5.5V, the charge pumps are disabled. Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the $V+$ and $V-$ supplies.

RS-232 Transmitters

The transmitters are inverting level translators that convert CMOS-logic levels to 5.0V EIA/TIA-232 levels. They guarantee a 250kbps data rate with worst-case loads of $3\text{k}\Omega$ in parallel with 1000pF, providing compatibility with PC-to-PC communication software such as LapLink™. Transmitters can be paralleled to drive multiple receivers. The MAX3243E has been specifically designed to drive serial mice. Figure 1 shows a complete system connection. When $\overline{\text{FORCEOFF}}$ is driven to ground, or the AutoShutdown circuitry senses invalid voltage levels on all receiver inputs, the transmitters are disabled and the outputs are forced into a high-impedance state. When powered off or shut down, the output can be driven up to $\pm 12\text{V}$. The transmitter inputs do not have pull-up resistors.

LapLink is a trademark of Traveling Software.

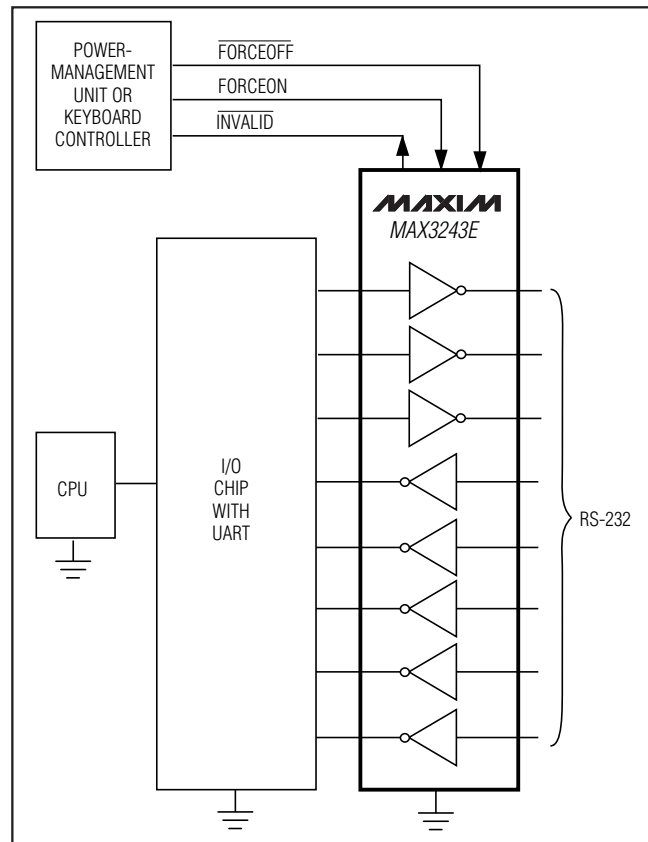

Figure 1. Interface Under Control of PMU

$\pm 15\text{kV}$ ESD-Protected, $1\mu\text{A}$, 3.0V to 5.5V, 250kbps, RS-232 Transceivers with AutoShutdown

RS-232 Receivers

The MAX3221E/MAX3223E/MAX3243E's receivers convert RS-232 signals to CMOS-logic output levels. All receivers have inverting three-state outputs and can be active or inactive. In shutdown ($\overline{\text{FORCEOFF}} = \text{low}$) or in AutoShutdown, the MAX3221E/MAX3223E's receivers are active (Table 1). Drive $\overline{\text{EN}}$ high to place the receiver(s) in a high-impedance state. The MAX3243E's receivers are high-impedance when the part is in shutdown ($\overline{\text{FORCEOFF}} = \text{low}$).

The MAX3243E features an extra, always-active complementary output (R2OUTB). R2OUTB monitors receiver activity while the other receivers are high-impedance. This allows Ring Indicator to be monitored without forward biasing other devices connected to the receiver outputs. This is ideal for systems where V_{CC} drops to 0 in shutdown to accommodate peripherals such as UARTs (Figure 2).

The MAX3221E/MAX3223E/MAX3243E feature an $\overline{\text{INVALID}}$ output that is enabled low when no valid RS-232 signal levels have been detected on all receiver inputs. $\overline{\text{INVALID}}$ is functional in any mode (Figures 3 and 5).

AutoShutdown

The MAX3221E/MAX3223E/MAX3243E achieve a $1\mu\text{A}$ supply current with Maxim's new AutoShutdown feature, which operates when $\overline{\text{FORCEON}}$ is low and $\overline{\text{FORCEOFF}}$ is high. When these devices sense no valid signal levels on all receiver inputs for $30\mu\text{s}$, the on-board charge pump and drivers are shut off, reducing supply current to $1\mu\text{A}$. This occurs if the RS-232 cable is disconnected or the connected peripheral transmitters are turned off. The device turns on again when a valid level is applied to any RS-232 receiver input. As a result, the system saves power without changes to the existing BIOS or operating system.

Table 2 and Figure 3c summarize the MAX3221E/MAX3223E/MAX3243E operating modes. $\overline{\text{FORCEON}}$ and $\overline{\text{FORCEOFF}}$ override AutoShutdown. When neither control is asserted, the IC selects between these states automatically, based on receiver input levels. Figures 3a, 3b, and 5a depict valid and invalid RS-232 receiver levels. Figure 5 shows the input levels and timing diagram for AutoShutdown operation.

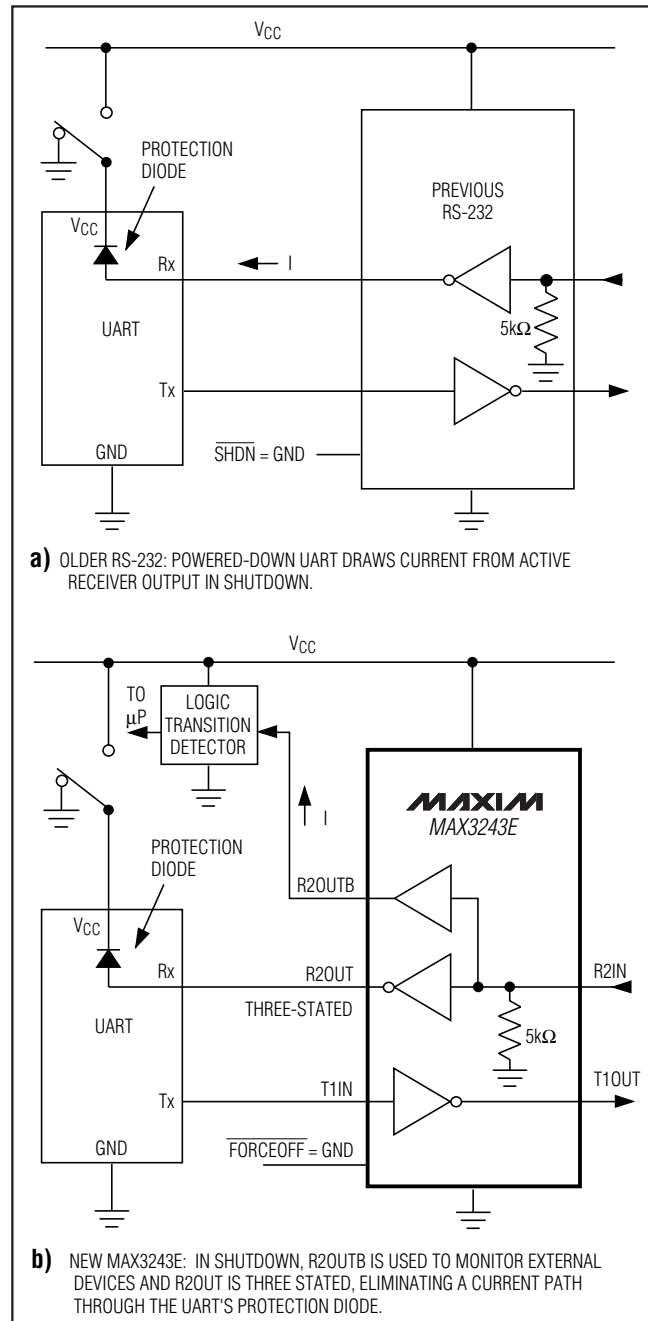

Figure 2. The MAX3243E detects RS-232 activity when the UART and interface are shut down.

$\pm 15\text{kV}$ ESD-Protected, $1\mu\text{A}$, 3.0V to 5.5V , 250kbps , RS-232 Transceivers with AutoShutdown

X = Don't Care

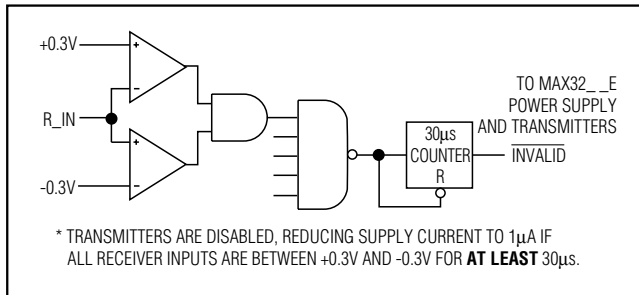

Figure 3a. MAX3221E/MAX3223E/MAX3243E Entering $1\mu\text{A}$ Supply Mode via AutoShutdown

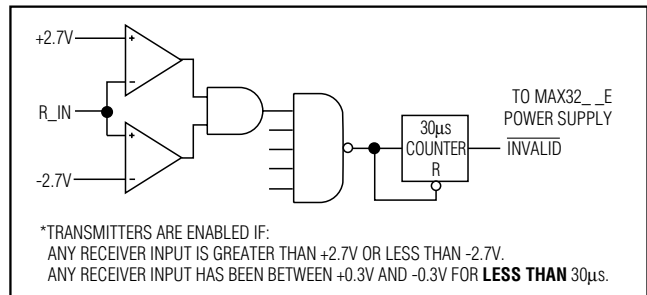

Figure 3b. MAX3221E/MAX3223E/MAX3243E with Transmitters Enabled Using AutoShutdown

A mouse or other system with AutoShutdown may need time to wake up. Figure 4 shows a circuit that forces the transmitters on for 100ms, allowing enough time for the other system to realize that the MAX3221E/MAX3223E/MAX3243E are awake. If the other system transmits valid RS-232 signals within that time, the RS-232 ports on both systems remain enabled.

When shut down, the device's charge pumps are off, V_+ is pulled to V_{CC} , V_- is pulled to ground, and the transmitter outputs are high impedance. The time required to exit shutdown is typically $100\mu\text{s}$ (Figure 5b).

Software-Controlled Shutdown

If direct software control is desired, $\overline{\text{INVALID}}$ can be used to indicate DTR or Ring Indicator signal. Connect FORCEOFF and FORCEON together to disable Auto-Shutdown so the line acts like a $\overline{\text{SHDN}}$ input.

$\pm 15\text{kV}$ ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The driver outputs and receiver inputs of the MAX3221E/MAX3223E/MAX3243E have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of $\pm 15\text{kV}$ without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, Maxim's E versions keep working without latchup, whereas competing RS-232 products can latch and must be powered down to remove latchup. See Table 4.

±15kV ESD-Protected, 1μA, 3.0V to 5.5V, 250kbps, RS-232 Transceivers with AutoShutdown

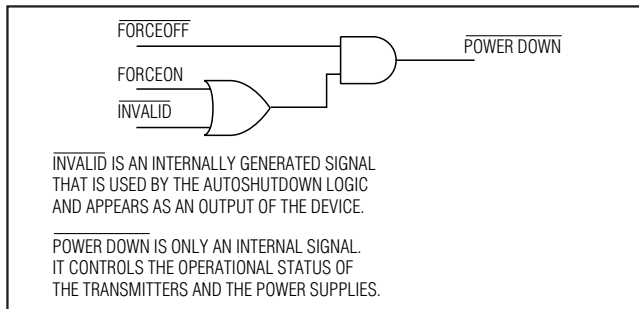

Figure 3c. MAX32_E AutoShutdown Logic

Figure 4. AutoShutdown with Initial Turn-On to Wake Up a Mouse or Another System

ESD protection can be tested in various ways; the transmitter outputs and receiver inputs of this product family are characterized for protection to the following limits:

- 1) ±15kV using the Human Body Model
- 2) ±8kV using the Contact Discharge Method specified in IEC1000-4-2
- 3) ±15kV using IEC1000-4-2's Air-Gap Method

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Human Body Model

Figure 6a shows the Human Body Model, and Figure 6b shows the current waveform it generates when discharged into a low impedance. This model consists of a 100pF capacitor charged to the ESD voltage of interest, which is then discharged into the test device through a 1.5kΩ resistor.

IEC1000-4-2

The IEC1000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX3221E/ MAX3223E/ MAX3243E help you design equipment that meets

Table 2. INVALID Truth Table

RS-232 SIGNAL PRESENT AT ANY RECEIVER INPUT	INVALID OUTPUT
Yes	High
No	Low

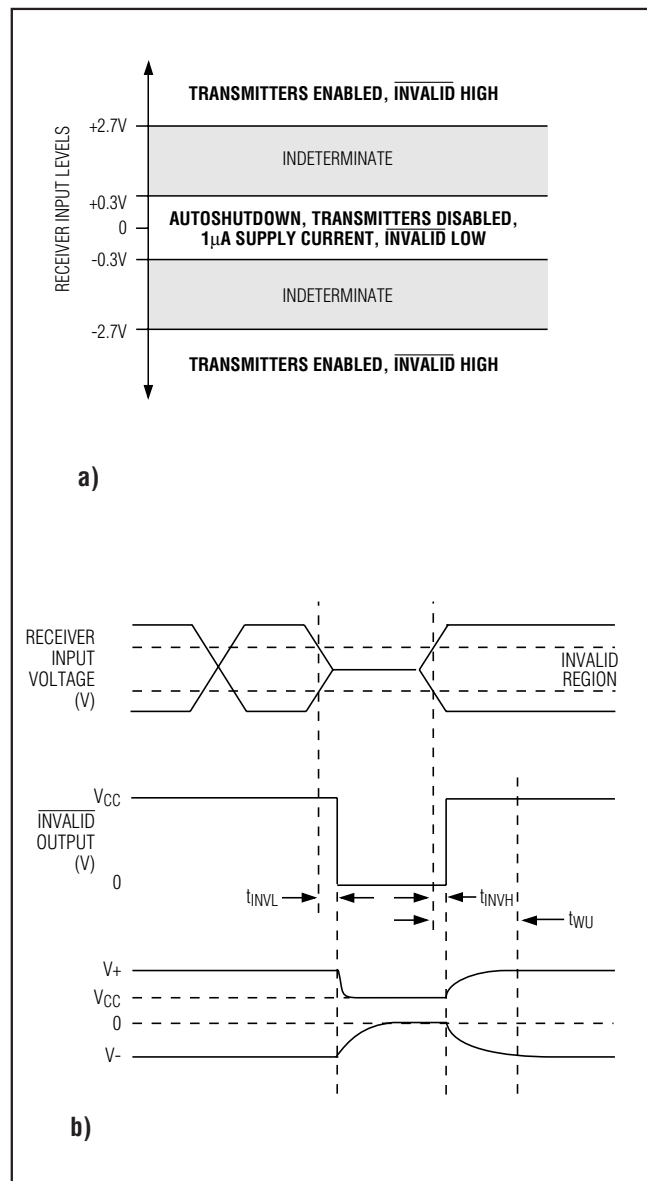

Figure 5. AutoShutdown Trip Levels

$\pm 15\text{kV}$ ESD-Protected, $1\mu\text{A}$, 3.0V to 5.5V , 250kbps , RS-232 Transceivers with AutoShutdown

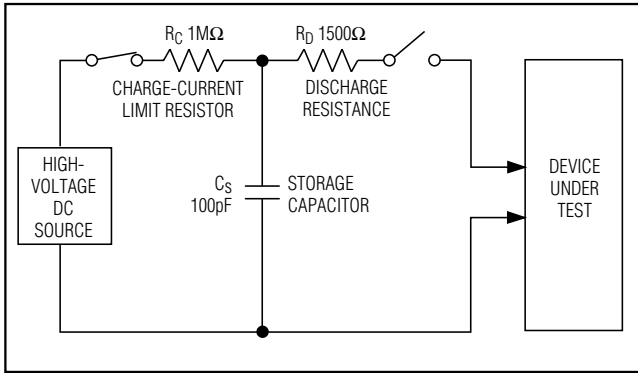

Figure 6a. Human Body ESD Test Models

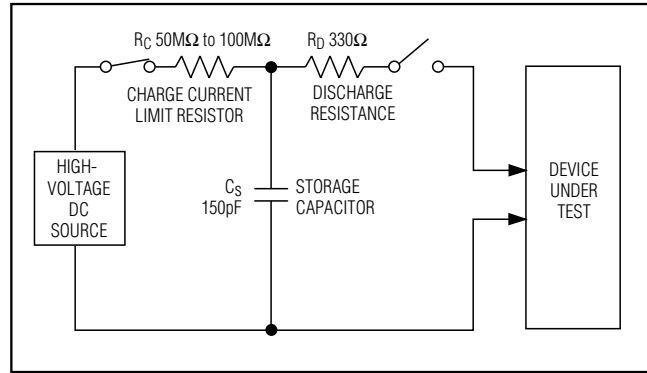

Figure 7a. IEC1000-4-2 ESD Test Model

Figure 6b. Human Body Model Current Waveform

Level 4 (the highest level) of IEC1000-4-2, without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC1000-4-2 is higher peak current in IEC1000-4-2, because series resistance is lower in the IEC1000-4-2 model. Hence, the ESD withstand voltage measured to IEC1000-4-2 is generally lower than that measured using the Human Body Model. Figure 7a shows the IEEE1000-4-2 model and Figure 7b shows the current waveform for the $\pm 8\text{kV}$ IEC1000-4-2 Level 4 ESD contact-discharge test.

The air-gap test involves approaching the device with a charged probe. The contact-discharge method connects the probe to the device before the probe is energized.

Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. Of course, all pins require this protection during manufacturing, not just RS-232 inputs and outputs.

Figure 7b. IEC1000-4-2 ESD Generator Current Waveform

Therefore, after PC board assembly, the Machine Model is less relevant to I/O ports.

Applications Information

Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation; either polarized or nonpolarized capacitors may be used. The charge pump requires $0.1\mu\text{F}$ capacitors for 3.3V operation. For other supply voltages, refer to Table 3 for required capacitor values. Do not use values smaller than those listed in Table 3. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. **However, do not increase C1 without also increasing the values of C2, C3, and C4 to maintain the proper ratios (C1 to the other capacitors).**

$\pm 15\text{kV}$ ESD-Protected, $1\mu\text{A}$, 3.0V to 5.5V , 250kbps , RS-232 Transceivers with AutoShutdown

When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR) usually rises at low temperatures and influences the amount of ripple on V_+ and V_- .

Power-Supply Decoupling

In most circumstances, a $0.1\mu\text{F}$ V_{CC} bypass capacitor is adequate. In applications that are sensitive to power-supply noise, use a capacitor of the same value as the charge-pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

Transmitter Outputs when Exiting Shutdown

Figure 8 shows two transmitter outputs when exiting shut down mode. As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter output is high, the other is low). Each transmitter is loaded with $3\text{k}\Omega$ in parallel with 1000pF . The transmitter outputs display no ringing or undesirable transients as they come out of shutdown, and are enabled only when the magnitude of V_- exceeds approximately -3V .

High Data Rates

The MAX3221E/MAX3223E/MAX3243E maintain the RS-232 $\pm 5.0\text{V}$ minimum transmitter output voltage even at high data rates. Figure 9 shows a transmitter loopback test circuit. Figure 10 shows a loopback test result at 120kbps , and Figure 11 shows the same test at 250kbps . For Figure 10, all three transmitters were driven simultaneously at 120kbps into RS-232 loads in parallel with 1000pF . For Figure 11, a single transmitter was driven at 250kbps , and all three transmitters were loaded with an RS-232 receiver in parallel with 1000pF .

Mouse Driveability (MAX3243E)

The MAX3243E has been specifically designed to power serial mice while operating from low-voltage power supplies. It has been tested with leading mouse brands such

Table 3. Required Capacitor Values

V_{CC} (V)	C1, C _{BYPASS} (μF)	C2, C3, C4 (μF)
3.0 to 3.6	0.22	0.22
3.15 to 3.6	0.1	0.1
4.5 to 5.5	0.047	0.33
3.0 to 5.5	0.22	1

Figure 8. Transmitter Outputs Exiting Shutdown or Powering Up

as Logitech and Microsoft. When tested, the MAX3243E successfully drove all serial mice and met their respective current and voltage requirements. The MAX3243E's regulated dual charge pump ensures the transmitters will supply at least $\pm 5\text{V}$ during worst-case conditions. Figure 12a shows the transmitter outputs under increasing load current. The AutoShutdown feature does not work with a mouse, so $\overline{\text{FORCEOFF}}$ and FORCEON should be connected to V_{CC} . Figure 12b (on the following page) shows a mouse driver test circuit. To achieve mouse driveability with $1\mu\text{A}$ supply current when the port is inactive, use parts with the AutoShutdown Plus feature (such as the MAX3244E and MAX3245E).
