

CMOS Latched 4/8 Channel Analog Multiplexers

ADG528A/ADG529A

FEATURES

- 44V Maximum Rating
- V_{SS} to V_{DD} Analog Signal Range
- Single/Dual Supply Specifications
- Wide Supply Ranges (10.8V to 16.5V)
- Microprocessor Compatible (100ns WR Pulse)
- Extended Plastic Temperature Range
(-40°C to +85°C)
- Low Leakage (20pA typ)
- Low Power Dissipation (28mW max)
- Available in 16-Lead DIP and
20-Lead LCCC/PLCC Packages
- Superior Alternative to:
DG528
DG529

GENERAL DESCRIPTION

The ADG528A and ADG529A are CMOS monolithic analog multiplexers with 8 channels and dual 4 channels respectively. On-chip latches facilitate microprocessor interfacing. The ADG528A switches one of 8 inputs to a common output depending on the state of three binary addresses and an enable input. The ADG529A switches one of 4 differential inputs to a common differential output depending on the state of two binary addresses and an enable input. Both devices have TTL and 5V CMOS logic compatible digital inputs.

The ADG528A and ADG529A are designed on an enhanced LC²MOS process which gives an increased signal capability of V_{SS} to V_{DD} and enables operation over a wide range of supply voltages. The devices can comfortably operate anywhere in the 10.8V to 16.5V single or dual supply range. These multiplexers also feature high switching speeds and low R_{ON} .

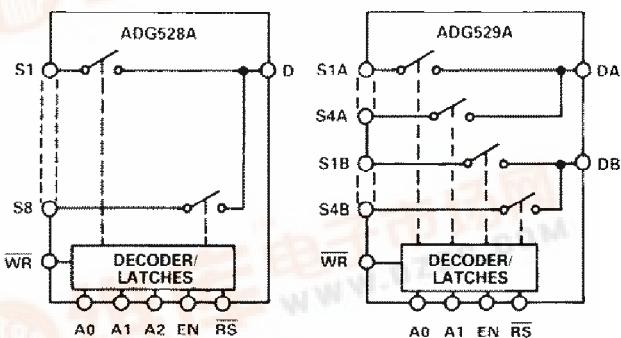

PRODUCT HIGHLIGHTS

1. Single/Dual Supply Specifications with a Wide Tolerance:
The devices are specified in the 10.8V to 16.5V range for both single and dual supplies.
2. Easily Interfaced:
The ADG528A and ADG529A can be easily interfaced with microprocessors. The \overline{WR} signal latches the state of the address control lines and the enable line. The \overline{RS} signal clears both the address and enable data in the latches resulting in no output (all switches off). \overline{RS} can be tied to the microprocessor reset pin.

REV. A

Information furnished by Analog Devices is believed to be accurate and reliable. However, no responsibility is assumed by Analog Devices for its use, nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Analog Devices.

FUNCTIONAL BLOCK DIAGRAMS

3. Extended Signal Range:

The enhanced LC²MOS processing results in a high breakdown and an increased analog signal range of V_{SS} to V_{DD} .

4. Break-Before-Make Switching:

Switches are guaranteed break-before-make so that input signals are protected against momentary shorting.

5. Low Leakage:

Leakage currents in the range of 20pA make these multiplexers suitable for high precision circuits.

ORDERING GUIDE

Model ¹	Temperature Range	Package Option ²
ADG528AKN	-40°C to +85°C	N-28
ADG528AKP	-40°C to +85°C	P-20A

ADG528A/ADG529A

ABSOLUTE MAXIMUM RATINGS*

($T_A = +25^\circ\text{C}$ unless otherwise noted)

V_{DD} to V_{SS}	44V
V_{DD} to GND	25V
V_{SS} to GND	-25V
Analog Inputs ¹	
Voltage at S, D	$V_{SS} - 2\text{V}$ to $V_{DD} + 2\text{V}$ or 20mA, Whichever Occurs First
Continuous Current, S or D	20mA
Pulsed Current S or D	
1ms Duration, 10% Duty Cycle	40mA

NOTE

¹Overvoltage at A, EN, WR, RS, S or D will be clamped by diodes. Current should be limited to the maximum rating above.

*COMMENT: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

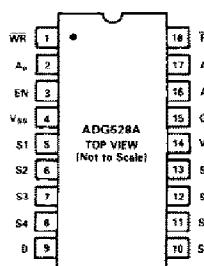

CAUTION

ESD (electrostatic discharge) sensitive device. The digital control inputs are diode protected; however, permanent damage may occur on unconnected devices subject to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. The protective foam should be discharged to the destination socket before devices are removed.

TIMING DIAGRAMS

Figure 1

Figure 1 shows the timing sequence for latching the switch address and enable inputs. The latches are level sensitive; therefore, while \overline{WR} is held low, the latches are transparent and the switches respond to the address and enable inputs. This input data is latched on the rising edge of \overline{WR} .

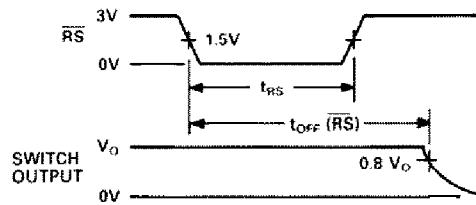

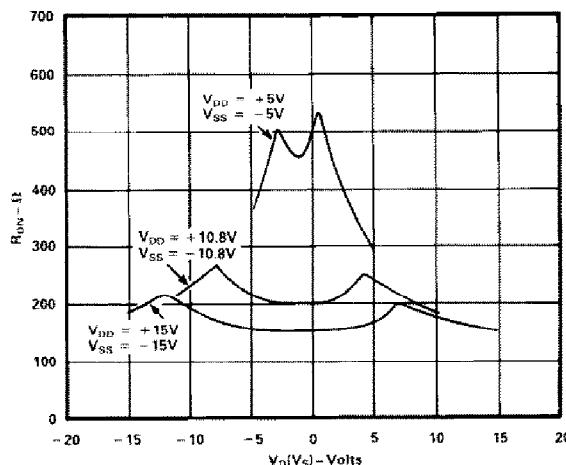

Figure 2

Figure 2 shows the Reset Pulse Width, t_{RS} , and Reset Turn-off Time, $t_{OFF}(\overline{RS})$.

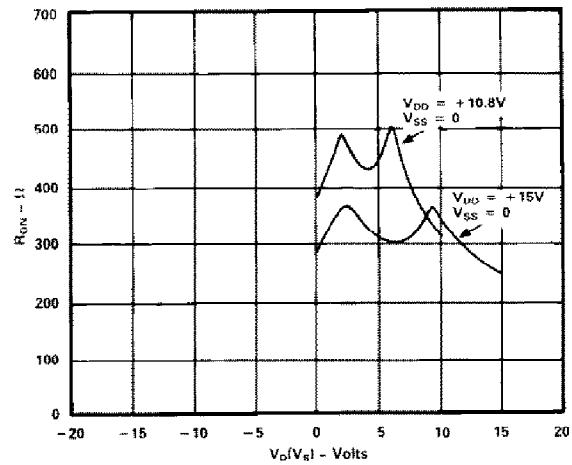

Note: All digital input signals rise and fall times measured from 10% to 90% of 3V. $t_R = t_F = 20\text{ns}$.

Typical Performance Characteristics

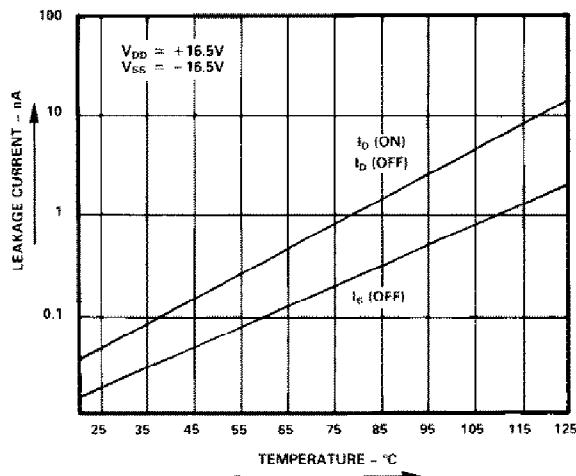

The multiplexers are guaranteed functional with reduced single or dual supplies down to 4.5V.

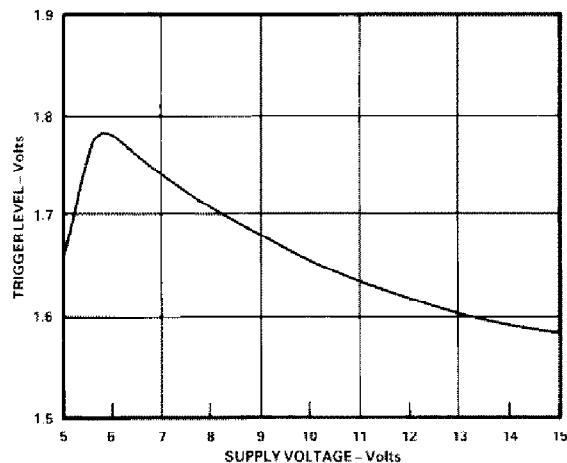

R_{ON} as a Function of $V_D(V_S)$: Dual Supply Voltage,
 $T_A = +25^\circ\text{C}$

R_{ON} as a Function of $V_D(V_S)$: Single Supply Voltage,
 $T_A = +25^\circ\text{C}$

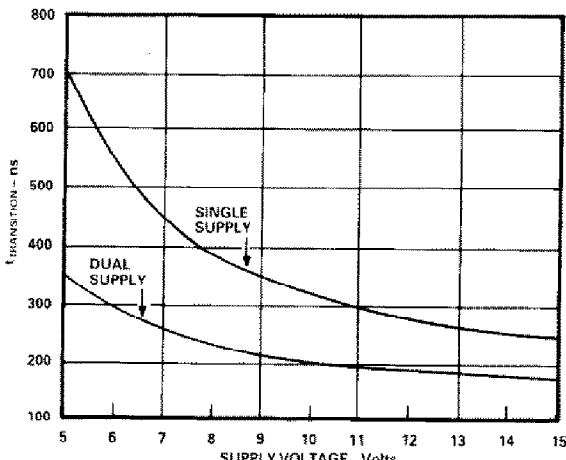

Leakage Current as a Function of Temperature
(Note: Leakage Currents Reduce as the Supply Voltages Reduce)

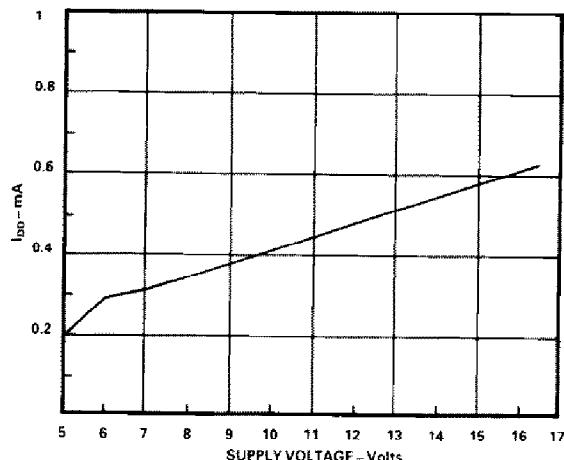

Trigger Levels vs. Power Supply Voltage, Dual or Single Supply, $T_A = +25^\circ\text{C}$

ADG528A/ADG529A

$I_{TRANSITION}$ vs. Supply Voltage: Dual and Single Supplies, $T_A = +25^\circ\text{C}$

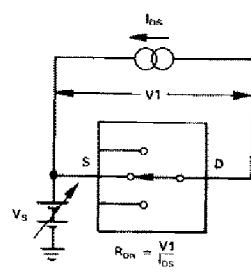

(Note: For V_{DD} and $|V_{SS}| < 10\text{V}$; $V1 = V_{DD}/V_{SS}$, $V2 = V_{SS}/V_{DD}$. See Test Circuit 6)

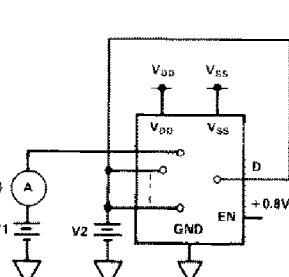

I_{DD} vs. Supply Voltage: Dual or Single Supply, $T_A = +25^\circ\text{C}$
