

## General Description

The MIC923 is a high-speed operational amplifier with a gain-bandwidth product of 410MHz. The part is unity gain stable. It has a very low 2.5mA supply current, and features the Teeny™SC70 package.

Supply voltage range is from  $\pm 2.5V$  to  $\pm 9V$ , allowing the MIC923 to be used in low-voltage circuits or applications requiring large dynamic range.

The MIC923 requires a minimum gain of +2 or -1 but is stable driving any capacitive load. It has excellent PSRR and CMRR, making it much easier to use than most conventional high-speed devices. Low supply voltage, low power consumption, and small packaging make the MIC923 ideal for portable equipment. The ability to drive capacitative loads also makes it possible to drive long coaxial cables.

## MIC923

### 410MHz Low-Power SC70 Op Amp

### Final Information

## Features

- 410MHz gain bandwidth product
- 2.5mA supply current
- Teeny™ SC70 packaging
- 2200V/ $\mu$ s slew rate
- Drives any capacitive load
- Stable with gain  $\geq 2$  or -1

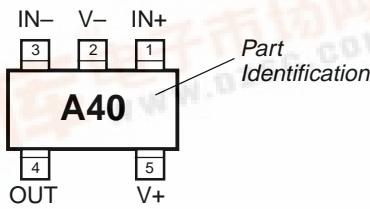

## Applications

- Video
- Imaging
- Ultrasound
- Portable equipment
- Line drivers

## Ordering Information

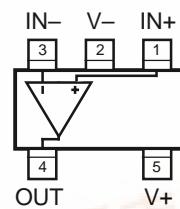

Part Number	Junction Temp. Range	Package
MIC923BC5	-40°C to +85°C	SC-70

## Pin Configuration

## Pin Description

Pin Number	Pin Name	Pin Function
1	IN+	Noninverting Input
2	V-	Negative Supply (Input)
3	IN-	Inverting Input
4	OUT	Output: Amplifier Output
5	V+	Positive Supply (Input)

**Absolute Maximum Ratings (Note 1)**

Supply Voltage ( $V_{V+} - V_{V-}$ )	20V
Differential Input Voltage ( $ V_{IN+} - V_{IN-} $ )	4V, <b>Note 3</b>
Input Common-Mode Range ( $V_{IN+}, V_{IN-}$ )	$V_{V+}$ to $V_{V-}$
Lead Temperature (soldering, 5 sec.)	260°C
Storage Temperature ( $T_S$ )	150°C
ESD Rating, <b>Note 4</b>	1.5kV

**Operating Ratings (Note 2)**

Supply Voltage ( $V_S$ )	$\pm 2.5V$ to $\pm 9V$
Junction Temperature ( $T_J$ )	-40°C to +85°C
Package Thermal Resistance SC70-5 ( $\theta_{JA}$ )	450°C/W

**Electrical Characteristics ( $\pm 5V$ )**

$V_+ = +5V$ ,  $V_- = -5V$ ,  $V_{CM} = 0V$ ,  $R_L = 10M\Omega$ ;  $T_J = 25^\circ C$ , **bold** values indicate  $-40^\circ C \leq T_J \leq +85^\circ C$ ; unless noted.

**Note 1.** Exceeding the absolute maximum rating may damage the device.

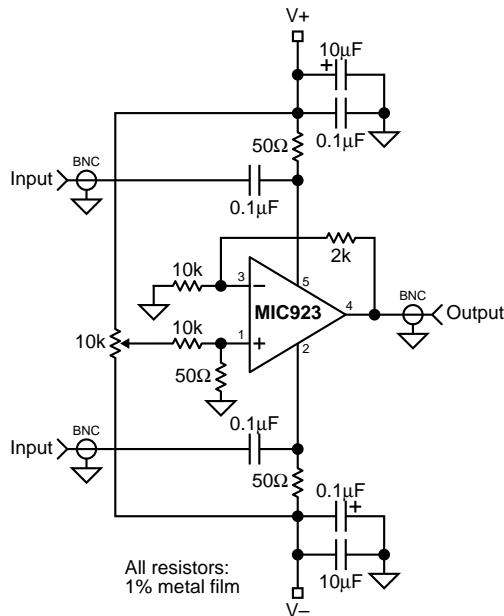

**Note 2.** The device is not guaranteed to function outside its operating rating.

**Note 3.** Exceeding the maximum differential input voltage will damage the input stage and degrade performance (in particular, input bias current is likely to change).

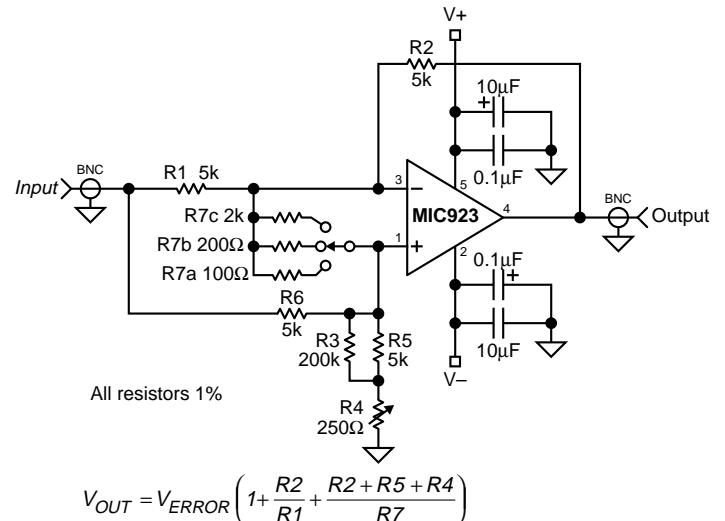

**Note 4.** Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k in series with 100pF.

**Note 5.** Output swing limited by the maximum output sink capability, refer to the short-circuit current vs. temperature graph in "Typical Characteristics."

## Applications Information

The MIC923 is a high-speed, voltage-feedback operational amplifier featuring very low supply current and excellent stability. This device is unity gain stable, capable of driving high capacitance loads.

### Driving High Capacitance

The MIC923 is stable when driving high capacitance, making it ideal for driving long coaxial cables or other high-capacitance loads. Most high-speed op amps are only able to drive limited capacitance.

Note: increasing load capacitance does reduce the speed of the device. In applications where the load capacitance reduces the speed of the op amp to an unacceptable level, the effect of the load capacitance can be reduced by adding a small resistor ( $<100\Omega$ ) in series with the output.

### Feedback Resistor Selection

Conventional op amp gain configurations and resistor selection apply, the MIC923 is NOT a current feedback device.

Also, for minimum peaking, the feedback resistor should have low parasitic capacitance, usually  $470\Omega$  is ideal. To use the part as a follower, the output should be connected to input via a short wire.

### Layout Considerations

All high speed devices require careful PCB layout. The following guidelines should be observed: Capacitance, particularly on the two inputs pins will degrade performance; avoid large copper traces to the inputs. Keep the output signal away from the inputs and use a ground plane.

It is important to ensure adequate supply bypassing capacitors are located close to the device.

### Power Supply Bypassing

Regular supply bypassing techniques are recommended. A  $10\mu F$  capacitor in parallel with a  $0.1\mu F$  capacitor on both the positive and negative supplies are ideal. For best performance all bypassing capacitors should be located as close to the op amp as possible and all capacitors should be low ESL (equivalent series inductance), ESR (equivalent series resistance). Surface-mount ceramic capacitors are ideal.

### Thermal Considerations

The SC70-5 package, like all small packages, have a high thermal resistance. It is important to ensure the IC does not exceed the maximum operating junction (die) temperature of  $85^\circ C$ . The part can be operated up to the absolute maximum temperature rating of  $125^\circ C$ , but between  $85^\circ C$  and  $125^\circ C$  performance will degrade, in particular CMRR will reduce.

An MIC923 with no load, dissipates power equal to the quiescent supply current  $\times$  supply voltage

$$P_{D(no\ load)} = (V_{V+} - V_{V-})I_S$$

When a load is added, the additional power is dissipated in the output stage of the op amp. The power dissipated in the device is a function of supply voltage, output voltage and output current.

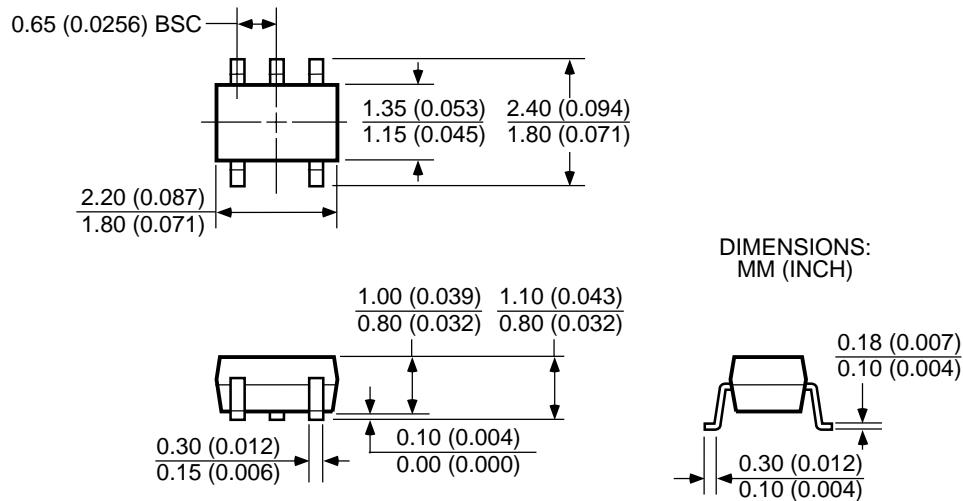

$$P_{D(output\ stage)} = (V_{V+} - V_{OUT})I_{OUT}$$

$$Total\ Power\ Dissipation = P_{D(no\ load)} + P_{D(output\ stage)}$$

Ensure the total power dissipated in the device is no greater than the thermal capacity of the package. The SC70-5 package has a thermal resistance of  $450^\circ C/W$ .

$$\text{Max. Allowable Power Dissipation} = \frac{T_{J(max)} - T_{A(max)}}{450^\circ C / W}$$
