## 9316/DM9316 Synchronous 4-Bit Counters

### General Description

These synchronous, presettable counters feature an internal carry look-ahead for application in high-speed counting designs. The 9316 is a 4-bit binary counter. The carry output is decoded by means of a NOR gate, thus preventing spikes during the normal counting mode of operation. Synchronous operation is provided by having all flip-flops clocked simultaneously so that the outputs change coincident with each other when so instructed by the count-enables inputs and internal gating. This mode of operating eliminates the output counting spikes which are normally associated with asynchronous (ripple clock) counters. A buffered clock input triggers the four flip-flops on the rising (positive-going) edge of the clock input waveform.

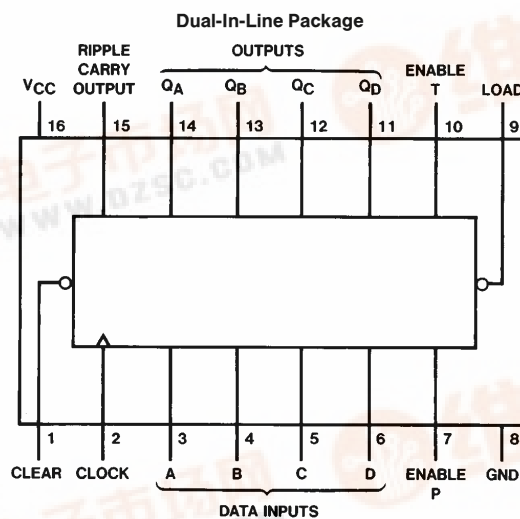

These counters are fully programmable; that is, the outputs may be preset to either level. As presetting is synchronous, setting up a low level at the load input disables the counter and causes the outputs to agree with the setup data after the next clock pulse regardless of the levels of the enable input. Low-to-high transitions at the load input are perfectly acceptable regardless of the logic levels on the clock or enable inputs. The clear function is asynchronous and a low level at the clear input sets of the flip-flop outputs low regardless of the levels of clock, load, or enable inputs.

The carry look-ahead circuitry provides for cascading counters for n-bit synchronous applications without additional gating. Instrumental in accomplishing this function are two count-enable inputs and a ripple carry output. Both count-enable inputs (P and T) must be high to count, and input T is fed-forward to enable the ripple carry output. The ripple carry output thus enabled will produce a high-level output pulse with a duration approximately equal to the high-level portion of the  $Q_A$  output. This high-level overflow ripple carry pulse can be used to enable successive cascaded stages. High-to-low level transitions at the enable P or T inputs may occur regardless of the logic level in the clock.

### Features

- Internal look-ahead for fast counting
- Carry output for n-bit cascading
- Synchronous counting
- Load control line
- Diode-clamped inputs
- Typical clock frequency 35 MHz
- Pin-for-pin replacements popular 54/74 counters 5416A/7416A (binary)
- Alternate Military/Aerospace device (9316) is available. Contact a National Semiconductor Sales Office/Distributor for specifications.

## Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage	7V
Input Voltage	5.5V
Operating Free Air Temperature Range	
Military	−55°C to +125°C
Commercial	0°C to +70°C
Storage Temperature Range	−65°C to +150°C

Note: The “Absolute Maximum Ratings” are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the “Electrical Characteristics” table are not guaranteed at the absolute maximum ratings. The “Recommended Operating Conditions” table will define the conditions for actual device operation.

**Note 1:** The minimum HOLD time is as specified or as long as the CLOCK input takes to rise from 0.8V to 2V, whichever is longer.

**Note 2:** All typicals are at V<sub>CC</sub> = 5V, T<sub>A</sub> = 25°C.

**Note 3:** Not more than one output should be shorted at a time.

**Note 4:** I<sub>CCH</sub> is measured with the LOAD input high, then again with the LOAD input low, with all other inputs high and all outputs open.

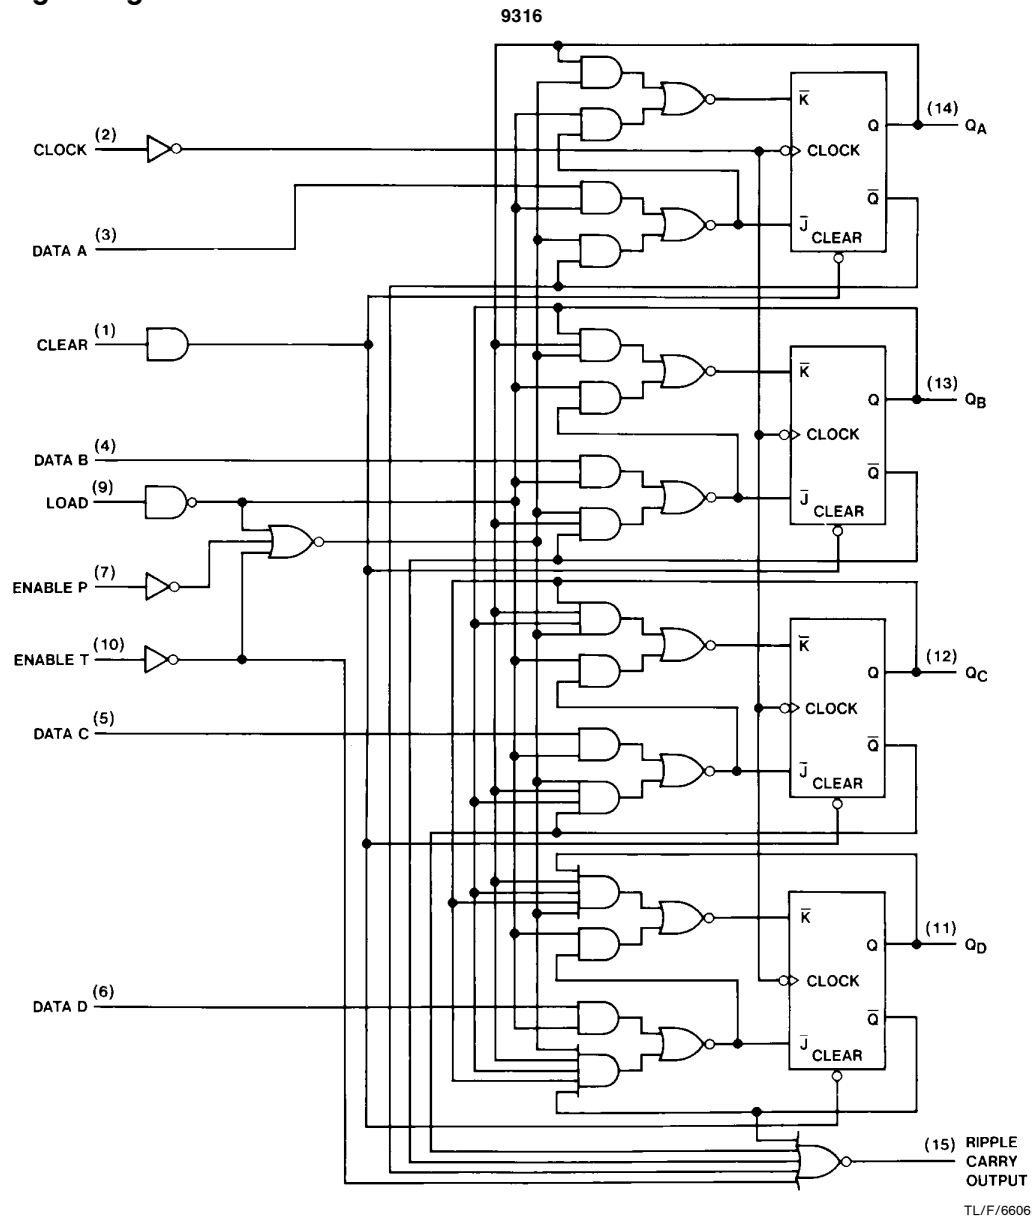

**Note 5:** I<sub>CCL</sub> is measured with the CLOCK input high, then again with the CLOCK input low, with all other inputs low and all outputs open.

**Note 6:** T<sub>A</sub> = 25°C and V<sub>CC</sub> = 5V.

## Parameter Measurement Information

TL/F/6606-4

**Note A:** The input pulses are supplied by a generator having the following characteristics:  $\text{PRR} \leq 1 \text{ MHz}$ , duty cycle  $\leq 50\%$ ,  $Z_{\text{OUT}} \approx 50\Omega$ ,  $t_r \leq 10 \text{ ns}$ ,  $t_f \leq 10 \text{ ns}$ . Vary PRR to measure  $f_{\text{MAX}}$ .

**Note B:** Outputs  $Q_D$  and carry are tested at  $t_n + 16$  for 9316/8316, where  $t_n$  is the bit time when all outputs are low.

**Note C:**  $V_{REF} = 1.5\text{V}$ .
