

## Differential 5:1 or 4:1 ECL/PECL Multiplexers with Single/Dual Output Buffers

### General Description

The MAX9386/MAX9387/MAX9388 are fully differential, high-speed, low-jitter ECL/PECL multiplexers (muxes) with output buffer(s). The devices are designed for clock-and-data distribution applications, and feature extremely low propagation delays (318ps, typ) and output-to-output skews (3.9ps, typ). The MAX9386 is a 5:1 mux with a single output buffer. The MAX9387 is a 5:1 mux with dual output buffers, and is intended for use in redundant systems. The MAX9388 is a 4:1 mux with a single output buffer, and is pin compatible with the MC100EP57.

Three single-ended select inputs, SEL0, SEL1, and SEL2, control the mux function on the MAX9386/MAX9387. The MAX9388 has two select inputs, SEL0 and SEL1. The mux select inputs are compatible with ECL/PECL logic, and are internally referenced to the on-chip output VBB, nominally VCC - 1.425V. The select inputs accept signals between VCC and VEE. Internal pulldowns to VEE ensure a low-default condition if the select inputs are left open.

The differential inputs D<sub>-</sub>,  $\bar{D}_-$  can be configured to accept a single-ended signal when the unused complementary input is connected to the on-chip reference output VBB. All the differential inputs have internal bias and clamping circuits that ensure low-default output states when the inputs are left open.

The MAX9386/MAX9387/MAX9388 operate with a wide supply range |VCC - VEE| of 2.375V to 5.5V. The MAX9386/MAX9388 are offered in 20-pin TSSOP and QSOP packages. The MAX9387 is offered in 24-pin TSSOP and QSOP packages.

### Applications

- High-Speed Telecom and Datacom Applications
- Central Office Backplane Clock Distribution
- DSLAM/DLC

### Features

- ◆ 318ps (typ) Propagation Delay
- ◆ >2.7GHz Toggle Frequency
- ◆ 0.3ps(RMS) Random Jitter
- ◆ <14ps (max) at +25°C Output-to-Output Skew (MAX9387)
- ◆ -2.375V to -5.5V Supplies for Differential LVECL/ECL
- ◆ +2.375V to +5.5V Supplies for Differential LVPECL/PECL
- ◆ Outputs Low for Open Inputs
- ◆ Dual Output Buffers (MAX9387)
- ◆ Pin Compatible with MC100EP57 (MAX9388EUP)
- ◆ >2kV ESD Protection (Human Body Model)

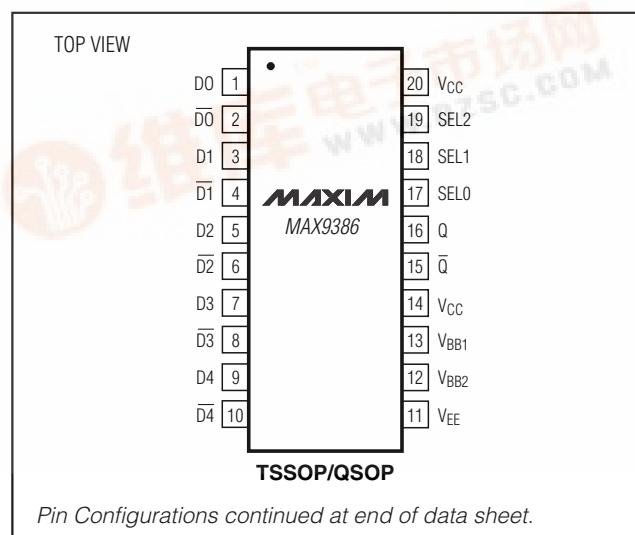

### Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	SELECTION
MAX9386EUP	-40°C to +85°C	20 TSSOP	5:1 mux with 1 output buffer
MAX9386EEP*	-40°C to +85°C	20 QSOP	5:1 mux with 1 output buffer

*Ordering Information continued at end of data sheet.*

# Differential 5:1 or 4:1 ECL/PECL Multiplexers with Single/Dual Output Buffers

## ABSOLUTE MAXIMUM RATINGS

$V_{CC} - V_{EE}$	-0.3V to +6.0V
Inputs ( $D_-$ , $\bar{D}_-$ , $SEL_-$ ) to $V_{EE}$	-0.3V to ( $V_{CC} + 0.3V$ )
$D_-$ to $\bar{D}_-$	$\pm 3.0V$
Continuous Output Current	50mA
Surge Output Current	100mA
$V_{BB_-}$ Sink/Source Current	$\pm 600\mu A$
Continuous Power Dissipation ( $T_A = +70^\circ C$ )	
20-Lead TSSOP (derate 11.0mW/ $^\circ C$ above $+70^\circ C$ )	880mW
$\theta_{JA}$ in Still Air	+91 $^\circ C/W$
$\theta_{JC}$	+20 $^\circ C/W$
24-Lead TSSOP (derate 12.2mW/ $^\circ C$ above $+70^\circ C$ )	976mW
$\theta_{JA}$ in Still Air	+82 $^\circ C/W$
$\theta_{JC}$	+15 $^\circ C/W$

20-Lead QSOP (derate 9.1mW/ $^\circ C$ above $+70^\circ C$ )	727mW
$\theta_{JA}$ in Still Air	+110 $^\circ C/W$
$\theta_{JC}$	+34 $^\circ C/W$
24-Lead QSOP (derate 9.5mW/ $^\circ C$ above $+70^\circ C$ )	762mW
$\theta_{JA}$ in Still Air	+105 $^\circ C/W$
$\theta_{JC}$	+34 $^\circ C/W$
Operating Temperature Range	-40 $^\circ C$ to +85 $^\circ C$
Junction Temperature	+150 $^\circ C$
Storage Temperature Range	-65 $^\circ C$ to +150 $^\circ C$
ESD Protection	
Human Body Model ( $\bar{D}_-$ , $D_-$ , $Q_-$ , $\bar{Q}_-$ , $SEL_-$ , $V_{BB_-}$ )	$\geq 2kV$
Lead Temperature (soldering, 10s)	+300 $^\circ C$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC ELECTRICAL CHARACTERISTICS

# Differential 5:1 or 4:1 ECL/PECL Multiplexers with Single/Dual Output Buffers

## Detailed Description

The MAX9386/MAX9387/MAX9388 are fully differential, high-speed, and low-jitter ECL/PECL muxes with output buffer(s). The devices are designed for clock-and-data distribution applications, and feature extremely low propagation delays (318ps, typ) and output-to-output skews (3.9ps, typ). The MAX9386 is a 5:1 mux with a single output buffer. The MAX9387 is a 5:1 mux with dual output buffers, and is intended for use in redundant systems. The MAX9388 is a 4:1 mux with a single output buffer, and is pin compatible with the MC100EP57.

Three single-ended select inputs, SEL0, SEL1, and SEL2, control the mux function on the MAX9386/ MAX9387. The MAX9388 has two select inputs, SEL0 and SEL1 (see Tables 1 and 2). The mux select inputs are compatible with ECL/PECL logic, and are internally referenced to the on-chip output VBB, nominally VCC - 1.425V. The select inputs accept signals between VCC and VEE. Internal 120k $\Omega$  pulldowns to VEE ensure a low default condition if the select inputs are left open, selecting the D0,  $\overline{D}0$  input.

The differential inputs D,  $\overline{D}$  can be configured to accept a single-ended signal when the unused complementary input is connected to the on-chip reference voltage

**Table 1. Mux Select Input Truth Table for MAX9386/MAX9387**

SEL2	SEL1	SEL0	DATA OUTPUT
L or open	L or open	L or open	D0*

L or open	H	L or open	D2
L or open	H	H	D3
H	X	X	D4

\*Default output when SEL0, SEL1, and SEL2 are left open.

**Table 2. Mux Select Input Truth Table for MAX9388**

SEL1	SEL0	DATA OUTPUT
L or open	L or open	D0*
L or open	H	D1
H	L or open	D2
H	H	D3

\*Default output when SEL0 and SEL1 are left open.

VBB. The reference output voltages, VBB1 and VBB2, provide the reference voltage for single-ended operation for each mux. A single-ended input of at least VBB  $\pm 100\text{mV}$  or a differential input of at least 100mV switches the outputs to the V<sub>OH</sub> and V<sub>OL</sub> levels specified in the *DC Electrical Characteristics*. The maximum magnitude of the differential input from D to  $\overline{D}$  is  $\pm 3.0\text{V}$ . This limit also applies to the difference between a single-ended input and any reference voltage input.

Specifications for the high and low voltages of a differential input (V<sub>IHD</sub> and V<sub>ILD</sub>) and the differential input voltage (VIHD - VILD) apply simultaneously.

### Single-Ended Operation

The recommended supply voltage for single-ended operation is 3.0V to 5.5V. The differential inputs (D,  $\overline{D}$ ) can be configured to accept single-ended inputs when operating at supply voltages greater than 2.725V. In single-ended mode operation, the unused complementary input needs to be connected to the on-chip reference voltage, VBB, as a reference. For example, the differential D,  $\overline{D}$  input is converted to a noninverting, single-ended input by connecting VBB to  $\overline{D}$  and connecting the single-ended input to D. Similarly, an inverting input is obtained by connecting VBB to D and connecting the single-ended input to  $\overline{D}$ . With a differential input configured as single ended (using VBB), the single-ended input can be driven to VCC or VEE or with a single-ended LVPECL/LVECL signal.

In single-ended mode operation, a user must ensure that the supply voltage (VCC - VEE) is greater than 2.725V. This is because the input high minimum level must be at (VEE + 1.2V) or higher for proper operation. The reference voltage, VBB, must be at least (VEE + 1.2V) for the same reason because it becomes the high-level input when a single-ended input swings below it. The minimum VBB output for the MAX9386/MAX9387/MAX9388 is (VCC - 1.38V). Substituting the minimum VBB output for (VBB = VEE + 1.2V) results in a minimum supply (VCC - VEE) of 2.725V. Rounding up to standard supplies gives the recommended single-ended operating supply ranges (VCC - VEE) of 3.0V to 5.5V.

When using the VBB reference output, bypass it with a 0.01 $\mu\text{F}$  ceramic capacitor to VCC. If not used, leave it open. The VBB reference can source or sink a total of 0.5mA (shared between VBB1 and VBB2), which is sufficient to drive five inputs.

# Differential 5:1 or 4:1 ECL/PECL Multiplexers with Single/Dual Output Buffers

## Applications Information

### Output Termination

Terminate the outputs through  $50\Omega$  to  $V_{CC}$  - 2V or use equivalent Thevenin terminations. Terminate each Q and  $\bar{Q}$  output with identical termination on each for minimal distortion. When a single-ended signal is taken from the differential output, terminate both Q and  $\bar{Q}$ .

Ensure that output currents do not exceed the current limits as specified in the *Absolute Maximum Ratings* table. Under all operating conditions, the device's total thermal limits should be observed.

### Supply Bypassing

Bypass  $V_{CC}$  to  $V_{EE}$  with high-frequency surface-mount ceramic  $0.1\mu F$  and  $0.01\mu F$  capacitors. For PECL, bypass each  $V_{CC}$  to  $V_{EE}$ . For ECL, bypass each  $V_{EE}$  to  $V_{CC}$ . Place the capacitors as close to the device as possible with the  $0.01\mu F$  capacitor closest to the device pins.

Use multiple vias when connecting the bypass capacitors to ground. When using the  $V_{BB1}$  or  $V_{BB2}$  reference outputs, bypass each one with a  $0.01\mu F$  ceramic capacitor to  $V_{CC}$ . If the  $V_{BB1}$  or  $V_{BB2}$  reference outputs are not used, they can be left open.

### Traces

Circuit board trace layout is very important to maintain the signal integrity of high-speed differential signals. Maintaining integrity is accomplished in part by reducing signal reflections and skew, and increasing common-mode noise immunity.

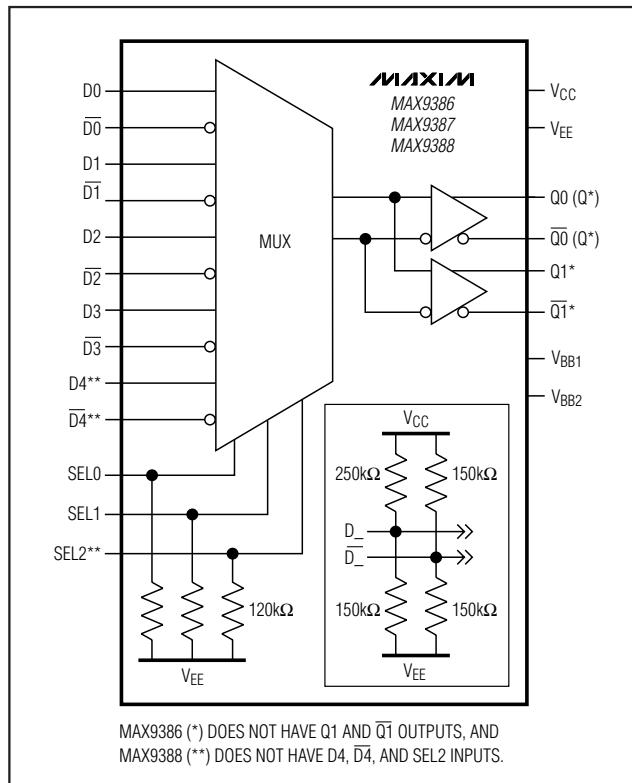

Signal reflections are caused by discontinuities in the  $50\Omega$  characteristic impedance of the traces. Avoid discontinuities by maintaining the distance between differential traces, not using sharp corners or using vias. Maintaining distance between the traces also increases common-mode noise immunity. Reducing signal skew is accomplished by matching the electrical length of the differential traces.

## Chip Information

TRANSISTOR COUNT: 583

PROCESS: Bipolar

## Functional Block Diagram
