

Voltage Detectors, ME2807 Series

General Description

ME2807 Series are a set of three-terminal low power voltage detectors implemented in CMOS technology. Each voltage detector in the series detects a particular fixed voltage ranging from 2.0V to 7.5V. The voltage detectors consist of a high precision and low power consumption standard voltage source, a comparator, hysteresis circuit, and an output driver. CMOS technology ensures low power consumption.

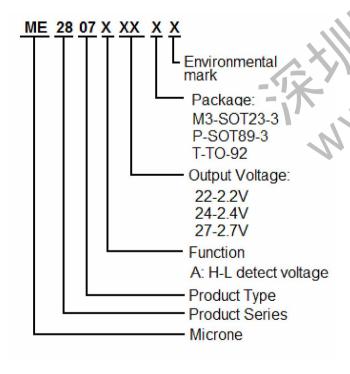

Features

- Highly accuracy: ±1%
- Low power consumption: TYP 1.8uA (Vin=3V)
- Detect voltage range: 2.0V~7.5V in 0.1V increments
- Operating voltage range: 1.5V~18V
- I Detect voltage temperature characteristics :

TYP±0.9mV/

- I Output configuration: CMOS
- I Package: SOT-23-3 SOT-89-3, TO-92

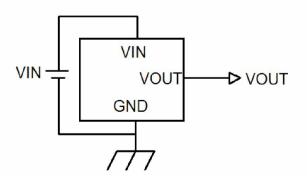

Selection Guide

Typical Application

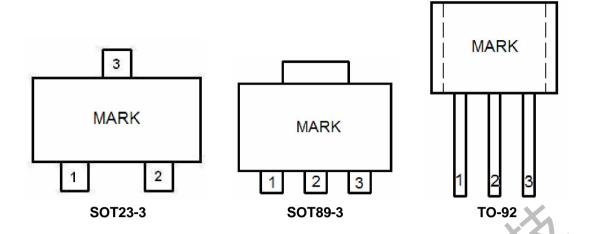

- battery checkers
- Level selectors
- I Power failure detectiors
 - Microcomputer reset
 - Battery backup of Memories

Typical Application Circuit

Functional Description

The ME2807 series is a set of voltage detectors equipped with a high stability voltage reference which is connected to the negative input of a comparator — denoted as V_{REF} in the following figure (Fig. 1). When the voltage drop to the positive input of the comparator (i,e, V_B) is higher than V_{REF} , VOUT goes high, M1 turns off, and VB is ex-pressed as VBH=VDD×(RB+RC)/(RA+RB+RC). If VDD is decreased so that VB falls to a value that is less than V_{REF} , the comparator output inverts (from high to low), VOUT goes low, V_C is high, M1 turns on, RC is bypassed, and V_B becomes: V_{BL} =VDD×RB/(RA+RB), which is less than V_{BH} . By so doing the comparator out-put will stay low to prevent the circuit from oscillating when V_B V_{REF} . If VDD falls bellow the minimum operating voltage, the output becomes undefined. When VDD goes from low to VDD×RB/(RA+RB) > V_{REF} , the comparator output goes high and VOUT goes high again. The detection voltage is as defined:

$$V_{DET(-)}=(RA+RB+RC)\times V_{REF}/(RB+RC)$$

The release voltage is as defined:

$$V_{DET(+)}=(RA+RB)\times V_{REF}/RB$$

The hysteresis width is:

$$V_{HYS}=V_{DET(+)}-V_{DET(-)}$$

Figure 1 demonstrates the CMOS output type with positive output polarity (VOUT is normally high, active low).
