## Logic Symbols

## Functional Description

The AC/ACT139 is a high-speed dual 1-of-4 decoder/demultiplexer. The device has two independent decoders, each of which accepts two binary weighted inputs ( $A_0-A_1$ ) and provides four mutually exclusive active-LOW outputs ( $O_0-O_3$ ). Each decoder has an active-LOW enable ( $\bar{E}$ ). When  $E$  is HIGH all outputs are forced HIGH. The enable can be used as the data input for a 4-output demultiplexer application. Each half of the AC/ACT139 generates all four minterms of two variables. These four minterms are useful in some applications, replacing multiple gate functions as shown in Figure 1, and thereby reducing the number of packages required in a logic network.

Fairchild does not recommend operation of FACT™ circuits outside databook specifications.
