

MAX809 Series, MAX810 Series

Very Low Supply Current 3-Pin Microprocessor Reset Monitors

The MAX809 and MAX810 are cost-effective system supervisor circuits designed to monitor V_{CC} in digital systems and provide a reset signal to the host processor when necessary. No external components are required.

The reset output is driven active within 10 μ sec of V_{CC} falling through the reset voltage threshold. Reset is maintained active for a minimum of 140 msec after V_{CC} rises above the reset threshold. The MAX810 has an active-high $\overline{\text{RESET}}$ output while the MAX809 has an active-low $\overline{\text{RESET}}$ output. The output of the MAX809 is guaranteed valid down to $V_{CC} = 1.0$ V. Both devices are available in a SOT-23 package.

The MAX809/810 are optimized to reject fast transient glitches on the V_{CC} line. Low supply current of 1.0 μ A ($V_{CC} = 3.2$ V) makes these devices suitable for battery powered applications.

Features

- Precision V_{CC} Monitor for 2.5 V, 3.0 V, 3.3 V, and 5.0 V Supplies
- Precision Monitoring Voltages from 1.6 V to 4.9 V Available in 100 mV Steps
- 140 msec Guaranteed Minimum $\overline{\text{RESET}}$ Output Duration
- $\overline{\text{RESET}}$ Output Guaranteed to $V_{CC} = 1.0$ V
- Low Supply Current
- V_{CC} Transient Immunity
- Small SOT-23 Package
- No External Components
- Wide Operating Temperature: -40°C to 105°C

Typical Applications

- Computers
- Embedded Systems
- Battery Powered Equipment
- Critical μ P Power Supply Monitoring

MAX809 Series, MAX810 Series

PIN DESCRIPTION

Pin No.	Symbol	Description
1	GND	Ground
2	RESET (MAX809)	RESET output remains low while V_{CC} is below the reset voltage threshold, and for 240 msec (typ.) after V_{CC} rises above reset threshold
2	RESET (MAX810)	RESET output remains high while V_{CC} is below the reset voltage threshold, and for 240 msec (typ.) after V_{CC} rises above reset threshold
3	V_{CC}	Supply Voltage (typ.)

ABSOLUTE MAXIMUM RATINGS* (Note 1)

Rating	Symbol	Value	Unit
Supply Voltage (V_{CC} to GND)	V_{CC}	6.0	V
RESET		-0.3 to ($V_{CC} + 0.3$)	V
Input Current, V_{CC}		20	mA
Output Current, RESET		20	mA
dV/dt (V_{CC})		100	V/ μ sec
Thermal Resistance, Junction to Air	$R_{\theta JA}$	491	$^{\circ}\text{C}/\text{W}$
Operating Temperature Range (Data given for MAX809 threshold levels: 1.60 V, 2.32 V, 2.93 V, 4.63 V and 4.90 V)	T_A	-40 to +105	$^{\circ}\text{C}$
Operating Temperature Range (Data given for MAX809 threshold levels: 2.63 V, 3.08 V, 4.00 V and 4.38 V; MAX810 threshold levels: 2.63 V, 2.93 V, 3.08 V, 4.38 V and 4.63 V)	T_A	-40 to +85	$^{\circ}\text{C}$
Storage Temperature Range	T_{stg}	-65 to +150	$^{\circ}\text{C}$
Lead Temperature (Soldering, 10 Seconds)	T_{sol}	+260	$^{\circ}\text{C}$
Latch-up performance:	$I_{Latch-up}$		mA
Positive		200	
Negative		200	

*Maximum Ratings are those values beyond which damage to the device may occur.

- This device series contains ESD protection and exceeds the following tests:
Human Body Model 2000 V per MIL-STD-883, Method 3015.
Machine Model Method 350 V.

- The maximum package power dissipation limit must not be exceeded.

$$P_D = \frac{T_{J(max)} - T_A}{R_{\theta JA}} \quad \text{with } T_{J(max)} = 150^{\circ}\text{C}$$

ELECTRICAL CHARACTERISTICS $T_A = -40^{\circ}\text{C}$ to $+105^{\circ}\text{C}$ unless otherwise noted. Typical values are at $T_A = +25^{\circ}\text{C}$. (Note 3)

The following data is given for MAX809 threshold levels: 1.60 V, 2.32 V, 2.93 V, 4.63 V and 4.90 V.

Characteristic	Symbol	Min	Typ	Max	Unit
V_{CC} Range $T_A = 0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$ $T_A = -40^{\circ}\text{C}$ to $+105^{\circ}\text{C}$		1.0 1.2	— —	5.5 5.5	V

MAX809 Series, MAX810 Series

APPLICATIONS INFORMATION

V_{CC} Transient Rejection

The MAX809 provides accurate V_{CC} monitoring and reset timing during power-up, power-down, and brownout/sag conditions, and rejects negative-going transients (glitches) on the power supply line. Figure 2 shows the maximum transient duration vs. maximum negative excursion (overdrive) for glitch rejection. Any combination of duration and overdrive which lies **under** the curve will **not** generate a reset signal. Combinations above the curve are detected as a brownout or power-down. Typically, transient that goes 100 mV below the reset threshold and lasts 5 μ s or less will not cause a reset pulse. Transient immunity can be improved by adding a capacitor in close proximity to the V_{CC} pin of the MAX809.

Figure 2. Maximum Transient Duration vs. Overdrive for Glitch Rejection at 25°C

RESET Signal Integrity During Power-Down

The MAX809 RESET output is valid to V_{CC} = 1.0 V. Below this voltage the output becomes an “open circuit” and does not sink current. This means CMOS logic inputs to the μ P will be floating at an undetermined voltage. Most digital systems are completely shutdown well above this voltage. However, in situations where RESET must be maintained

valid to V_{CC} = 0 V, a pull-down resistor must be connected from RESET to ground to discharge stray capacitances and hold the output low (Figure 3). This resistor value, though not critical, should be chosen such that it does not appreciably load RESET under normal operation (100 k Ω will be suitable for most applications).

Figure 3. Ensuring RESET Valid to V_{CC} = 0 V

Processors With Bidirectional I/O Pins

Some μ P's (such as Motorola 68HC11) have bi-directional reset pins. Depending on the current drive capability of the processor pin, an indeterminate logic level may result if there is a logic conflict. This can be avoided by adding a 4.7 k Ω resistor in series with the output of the MAX809 (Figure 4). If there are other components in the system which require a reset signal, they should be buffered so as not to load the reset line. If the other components are required to follow the reset I/O of the μ P, the buffer should be connected as shown with the solid line.

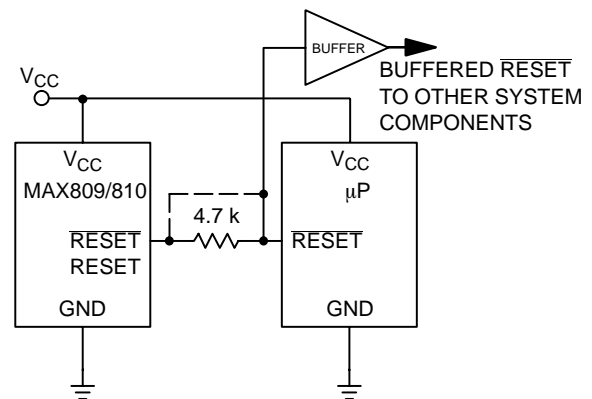

Figure 4. Interfacing to Bidirectional Reset I/O
