<sup>\*1</sup> The optically induced leakage current is current which can be measured at transistor if LED = "ON" and LED = "OFF".

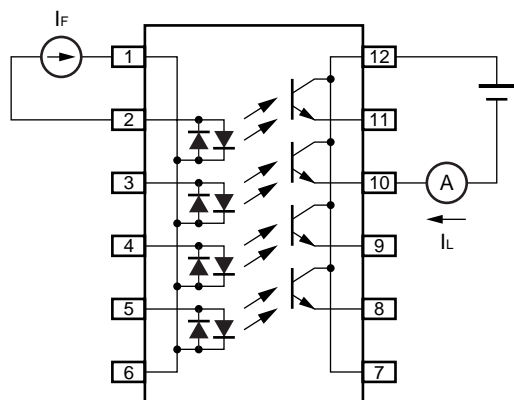

LED of channel 1 is switched to "ON".

At Tr-output of channel 2 a voltage is applied and one can measure a current between emitter and collector.

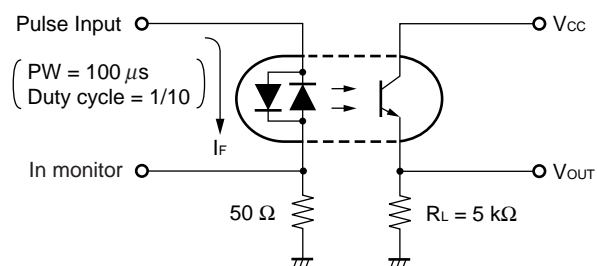

This is leakage current (at  $I_F = 5 \text{ mA}, V_{CEO} = 24 \text{ V}$ ).

(b) Please be sure that the temperature of the package would not be heated over 100°C.

**(4) Cautions**

- Fluxes

Avoid removing the residual flux with freon-based and chlorine-based cleaning solvent.

**2. Cautions regarding noise**

Be aware that when voltage is applied suddenly between the photocoupler's input and output or between collector-emitters at startup, the output transistor may enter the on state, even if the voltage is within the absolute maximum ratings.

**USAGE CAUTIONS**

1. Protect against static electricity when handling.
2. Avoid storage at a high temperature and high humidity.
