## **COMPLEMENTARY OUTPUT HALL EFFECT LATCHED SINK DRIVER**

### **FEATURES**

- On-chip Hall sensor with two different sensitivity and hysteresis settings for A277.
- Internal bandgap regulator allows temperature compensated operations and a wide operating voltage range.
- High output sinking capability up to 400mA for driving large load.
- Lower current change rate reduces the peak output voltages during switching.
- Build in protection diode for chip reverse power connecting.
- Available in die form or rugged low profile 4 pin SIP packages.

### **GENERAL DESCRIPTION**

A277 are integrated Hall sensors with output drivers designed for electronic commutation of brushless DC motor applications. The device includes an on-chip Hall voltage generator for magnetic sensing, a comparator that amplifies the Hall voltage, and a Schmitt trigger to provide switching hysteresis for noise rejection, and complementary open-collector drivers for sinking large current loads. An internal bandgap regulator is used to provide temperature compensated supply voltage for internal circuits and allows a wide operating supply range.

If a magnetic flux density larger than threshold Bop, DO is turned on(low) and DOB is turned off (high). The output state is held until a magnetic flux density reversal falls below Brp causing DO to be turned off and DOB turned on.

A277 are rated for operation over temperature range from -20 °C to 85 °C and voltage range from 3.5V to 20V. The devices are available in low cost die forms or rugged 4 pin SIP packages.

## APPLICATIONS

- Brushless DC Motor
- Brushless DC Fan
- Revolution Counting
- Speed Measurement
