

**64K x 32  
3.3V Synchronous SRAM  
Pipelined Outputs  
Burst Counter, Single Cycle Deselect**

**IDT71V632**

**Features**

- ◆ 64K x 32 memory configuration
- ◆ Supports high system speed:
  - Commercial:
    - A4 4.5ns clock access time (117 MHz)
  - Commercial and Industrial:
    - 5 5ns clock access time (100 MHz)
    - 6 6ns clock access time (83 MHz)
    - 7 7ns clock access time (66 MHz)
- ◆ Single-cycle deselect functionality (Compatible with Micron Part # MT58LC64K32D7LG-XX)
- ◆  $\overline{\text{LBO}}$  input selects interleaved or linear burst mode
- ◆ Self-timed write cycle with global write control ( $\overline{\text{GW}}$ ), byte write enable ( $\overline{\text{BWE}}$ ), and byte writes ( $\overline{\text{BWx}}$ )
- ◆ Power down controlled by ZZ input
- ◆ Operates with a single 3.3V power supply (+10/-5%)
- ◆ Packaged in a JEDEC Standard 100-pin rectangular plastic thin quad flatpack (TQFP).

with full support of the Pentium™ and PowerPC™ processor interfaces. The pipelined burst architecture provides cost-effective 3-1-1-1 secondary cache performance for processors up to 117MHz.

The IDT71V632 SRAM contains write, data, address, and control registers. Internal logic allows the SRAM to generate a self-timed write based upon a decision which can be left until the extreme end of the write cycle.

The burst mode feature offers the highest level of performance to the system designer, as the IDT71V632 can provide four cycles of data for a single address presented to the SRAM. An internal burst address counter accepts the first cycle address from the processor, initiating the access sequence. The first cycle of output data will be pipelined for one cycle before it is available on the next rising clock edge. If burst mode operation is selected ( $\overline{\text{ADV}}=\text{LOW}$ ), the subsequent three cycles of output data will be available to the user on the next three rising clock edges. The order of these three addresses will be defined by the internal burst counter and the  $\overline{\text{LBO}}$  input pin.

The IDT71V632 SRAM utilizes IDT's high-performance, high-volume 3.3V CMOS process, and is packaged in a JEDEC Standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) for optimum board density in both desktop and notebook applications.

**Description**

The IDT71V632 is a 3.3V high-speed SRAM organized as 64K x 32

## Pin Definitions<sup>(1)</sup>

Symbol	Pin Function	I/O	Active	Description
A <sub>0</sub> –A <sub>15</sub>	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK and $\overline{ADSC}$ Low or $\overline{ADSP}$ Low and $\overline{CE}$ Low.
$\overline{ADSC}$	Address Status (Cache Controller)	I	LOW	Synchronous Address Status from Cache Controller. $\overline{ADSC}$ is an active LOW input that is used to load the address registers with new addresses. $\overline{ADSC}$ is NOT GATED by $\overline{CE}$ .
$\overline{ADSP}$	Address Status (Processor)	I	LOW	Synchronous Address Status from Processor. $\overline{ADSP}$ is an active LOW input that is used to load the address registers with new addresses. $\overline{ADSP}$ is gated by $\overline{CE}$ .
$\overline{ADV}$	Burst Address Advance	I	LOW	Synchronous Address Advance. $\overline{ADV}$ is an active LOW input that is used to advance the internal burst counter, controlling burst access after the initial address is loaded. When this input is HIGH the burst counter is not incremented; that is, there is no address advance.
$\overline{BWE}$	Byte Write Enable	I	LOW	Synchronous byte write enable gates the byte write inputs $\overline{BW1}$ – $\overline{BW4}$ . If $\overline{BWE}$ is LOW at the rising edge of CLK then $\overline{BWx}$ inputs are passed to the next stage in the circuit. A byte write can still be blocked if $\overline{ADSP}$ is LOW at the rising edge of CLK. If $\overline{ADSP}$ is HIGH and $\overline{BWx}$ is LOW at the rising edge of CLK then data will be written to the SRAM. If $\overline{BWE}$ is HIGH then the byte write inputs are blocked and only $\overline{GW}$ can initiate a write cycle.
$\overline{BW1}$ – $\overline{BW4}$	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. $\overline{BW1}$ controls I/O(7:0), $\overline{BW2}$ controls I/O(15:8), etc. Any active byte write causes all outputs to be disabled. $\overline{ADSP}$ LOW disables all byte writes. $\overline{BW1}$ – $\overline{BW4}$ must meet specified setup and hold times with respect to CLK.
$\overline{CE}$	Chip Enable	I	LOW	Synchronous chip enable. $\overline{CE}$ is used with $\overline{CS0}$ and $\overline{CS1}$ to enable the IDT71V632. $\overline{CE}$ also gates $\overline{ADSP}$ .
CLK	Clock	I	N/A	This is the clock input. All timing references for the device are made with respect to this input.
$\overline{CS0}$	Chip Select 0	I	HIGH	Synchronous active HIGH chip select. $\overline{CS0}$ is used with $\overline{CE}$ and $\overline{CS1}$ to enable the chip.
$\overline{CS1}$	Chip Select 1	I	LOW	Synchronous active LOW chip select. $\overline{CS1}$ is used with $\overline{CE}$ and $\overline{CS0}$ to enable the chip.
$\overline{GW}$	Global Write Enable	I	LOW	Synchronous global write enable. This input will write all four 8-bit data bytes when LOW on the rising edge of CLK. $\overline{GW}$ supercedes individual byte write enables.
I/O <sub>0</sub> –I/O <sub>31</sub>	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. Both the data input path and data output path are registered and triggered by the rising edge of CLK.
$\overline{LBO}$	Linear Burst Order	I	LOW	Asynchronous burst order selection DC input. When $\overline{LBO}$ is HIGH the Interleaved (Intel) burst sequence is selected. When $\overline{LBO}$ is LOW the Linear (PowerPC) burst sequence is selected. $\overline{LBO}$ is a static DC input and must not change state while the device is operating.
$\overline{OE}$	Output Enable	I	LOW	Asynchronous output enable. When $\overline{OE}$ is LOW the data output drivers are enabled on the I/O pins if the chip is also selected. When $\overline{OE}$ is HIGH the I/O pins are in a high-impedance state.
V <sub>DD</sub>	Power Supply	N/A	N/A	3.3V core power supply inputs.
V <sub>DDQ</sub>	Power Supply	N/A	N/A	3.3V I/O power supply inputs.
V <sub>SS</sub>	Ground	N/A	N/A	Core ground pins.
V <sub>SSQ</sub>	Ground	N/A	N/A	I/O ground pins.
NC	No Connect	N/A	N/A	NC pins are not electrically connected to the chip.
ZZ	Sleep Mode	I	HIGH	Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71V632 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode.

**NOTE:**

1. All synchronous inputs must meet specified setup and hold times with respect to CLK.

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>DD</sub>, V<sub>DDQ</sub> and Input terminals only.
- I/O terminals.

### NOTES:

1. O1 (Ax) represents the first output from the external address Ax. O1 (Ay) represents the first output from the external address Ay. O2 (Ay) represents the next output data in the burst sequence of the base address Ay, etc. where Ao and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. ZZ input is LOW and LBO is Don't Care for this cycle.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

### Timing Waveform of Combined Pipelined Read and Write Cycles<sup>(1,2,3)</sup>

3619 dhw 07

**NOTES:**

1. Device is selected through entire cycle;  $\overline{OE}$  and  $\overline{CS1}$  are LOW,  $\overline{CS0}$  is HIGH.
2. ZZ input is LOW and  $\overline{LBO}$  is Don't Care for this cycle.
3. O1(Ax) represents the first output from the external address Ax. I1 (Ay) represents the first input from the external address Ay. O1(Az) represents the first output from the external address Az. O2(Az) represents the next output data in the burst sequence of the base address Az, etc. where Ao and A1 are advancing for the four word burst in the sequence defined by the state of the  $\overline{LBO}$  input.

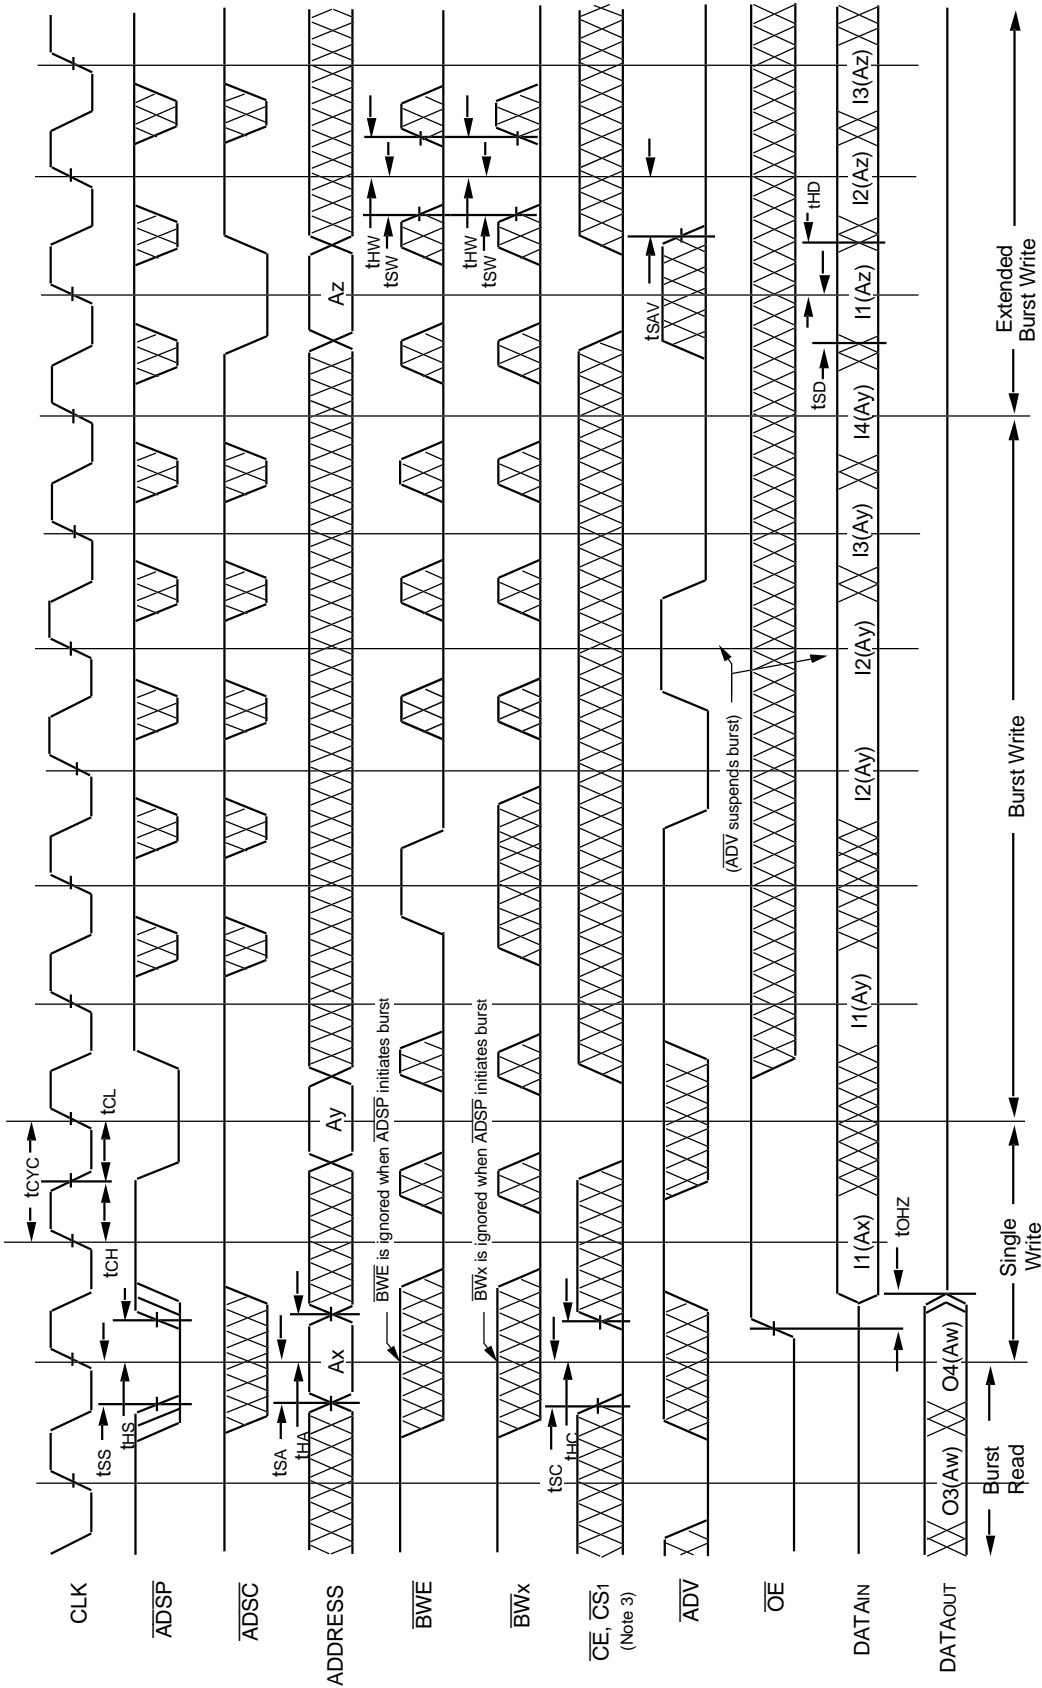

### Timing Waveform of Write Cycle No. 1 — **GW** Controlled<sup>(1,2,3)</sup>

**NOTES:**

1. Z $\bar{Z}$  input is LOW,  $\overline{BWE}$  is HIGH, and  $\overline{LBO}$  is Don't Care for this cycle.
2. 04(Aw) represents the final output data in the burst sequence of the base address Aw. 11(Ax) represents the first input from the external address Ax. 11(Ay) represents the first input from the external address Ay. 12(Ay) represents the next input data in the burst sequence of the base address Ay, etc. where A0 and A1 are advancing for the four word burst in the sequence defined by the state of the  $\overline{LBO}$  input. In the case of input 12(Ay) this data is valid for two cycles because ADV is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the  $\overline{CE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{CE}$  and  $\overline{CS1}$  are LOW on this waveform, CS0 is HIGH.

### Timing Waveform of Write Cycle No. 2 — Byte Controlled(1,2,3)

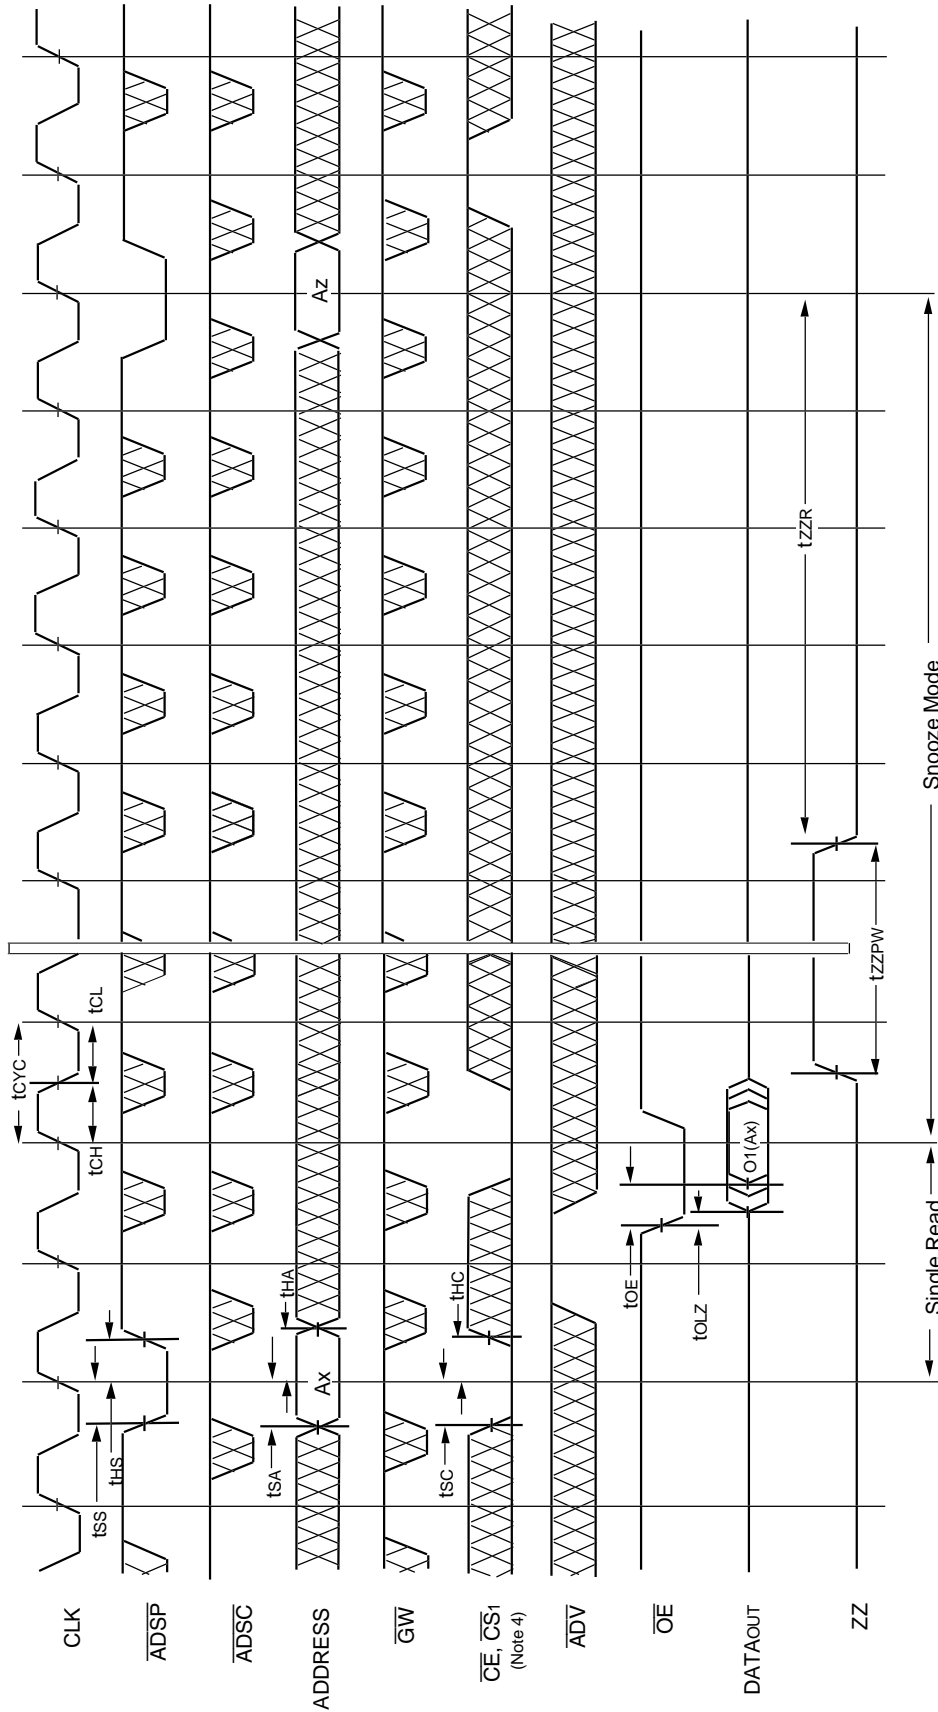

3619 drw.09

**NOTES:**

1. Zz input is LOW,  $\overline{G\overline{W}}$  is HIGH, and  $\overline{L\overline{B}\overline{O}}$  is Don't Care for this cycle.
2. O4(Aw) represents the final output data in the burst sequence of the base address Aw. 11(Ax) represents the first input from the external address Ax. 11(Ay) represents the first input from the external address Ay. 12(Ay) represents the next input data in the burst sequence of the base address Ay, etc. where Ax and Ay are advancing for the four word burst in the sequence defined by the state of the  $\overline{L\overline{B}\overline{O}}$  input. In the case of input 12(Ay) this data is valid for two cycles because ADV is high and has suspended the burst.
3. CS0 timing transitions are identical but inverted to the  $\overline{C\overline{E}}$  and  $\overline{C\overline{S}1}$  signals. For example, when  $\overline{C\overline{E}}$  and  $\overline{C\overline{S}1}$  are LOW on this waveform, CS0 is HIGH.

### Timing Waveform of Sleep (ZZ) and Power-Down Modes(1,2,3)

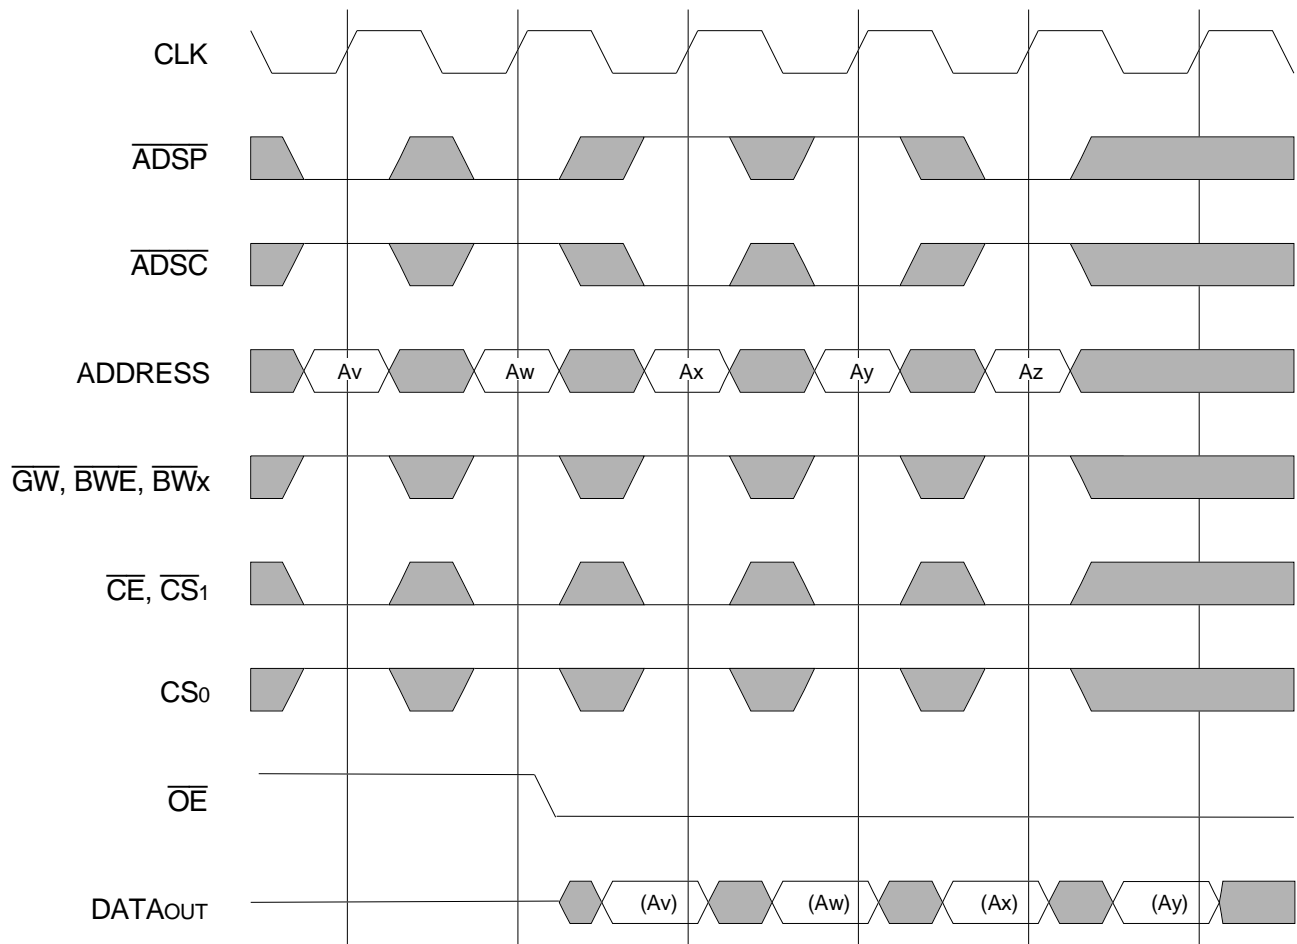

3619 dmv 10

**NOTES:**

1. Device must power up in deselected Mode.
2.  $\overline{LBO}$  input is Don't Care for this cycle.
3. It is not necessary to retain the state of the input registers throughout the Power-down cycle.
4.  $\overline{CS0}$  timing transitions are identical but inverted to the  $\overline{OE}$  and  $\overline{CS1}$  signals. For example, when  $\overline{OE}$  and  $\overline{CS1}$  are LOW on this waveform,  $\overline{CS0}$  is HIGH.

## Non-Burst Read Cycle Timing Waveform

3619 drw 11

**NOTES:**

1. ZZ input is LOW,  $\overline{ADV}$  is HIGH and  $\overline{LB0}$  is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. For read cycles,  $\overline{ADSP}$  and  $\overline{ADSC}$  function identically and are therefore interchangeable.

## Non-Burst Write Cycle Timing Waveform

3619 drw 12

### NOTES:

1.  $\overline{ZZ}$  input is LOW,  $\overline{ADV}$  and  $\overline{OE}$  are HIGH, and  $\overline{LBO}$  is Don't Care for this cycle.
2. (Ax) represents the data for address Ax, etc.
3. Although only  $\overline{GW}$  writes are shown, the functionality of  $\overline{BWE}$  and  $\overline{BWx}$  together is the same as  $\overline{GW}$ .
4. For write cycles,  $\overline{ADSP}$  and  $\overline{ADSC}$  have different limitations.

## **Datasheet Document History**

9/9/99		Updated to new format
	Pg. 1, 8, 9, 17	Revised speed offerings to 66–117MHz
	Pg. 15, 16	Added non-burst read and write cycle timing diagrams
	Pg. 18	Added Datasheet Document History
09/30/99	Pg. 1, 4, 8, 9, 17	Added industrial temperature range offerings
04/04/00	Pg. 17	Added 100pinTQFP package Diagram Outline
08/09/00		Not recommended for new designs
08/17/01		Removed “Not recommended for new designs” from the background on the datasheet
