Technical note 1

$$f_H(\text{nom}) = 26.8 \text{ kHz}$$

$$R1 = 6.8 \text{ k}\Omega$$

$$R2 = 56 \text{ k}\Omega$$

$$C2 = 1.8 \text{ nF}$$

$$f_{\text{pull-in}} = f_H(\text{nom}) \frac{|V_3 - V_1| / R2}{V_1 / R1} = f_H(\text{nom}) \frac{I_f}{I_o} \quad (\text{A})$$

where: $V_1 = 3.5V$ and $|V_3 - V_1|$ is the control voltage range.

The voltage at Pin 3 is limited by two clamping diodes at the voltage V_{3H} and V_{3L} .

When the PLL1 is synchronized and perfectly tuned, $V_3 = V_1$.

Remark: The value of C2 influences the horizontal oscillator free running frequency; it doesn't effect the relative pull-in range. If the horizontal frequency is changed by using R1, the pull-in range changes accordingly with the formula (A).

Technical note 2

The internal pulse "t_s", is generated by the current generator "I₅" charging the external capacitor "C5", according with the formula (B):

$$t_s = \frac{C5 \cdot V_5}{I_5} \quad (\text{B}), \quad t_s = \frac{T_H}{12} \quad \text{is recommended.}$$

Technical note 3

$K_9 = 67.5$ degrees/volt represents the slope of the oscillator charging period of the waveform at

Pin 2:

$$K_9 = \frac{360 \times 0.75}{4} \frac{\text{degree}}{\text{V}}$$

Technical note 4

The second PLL can recover the storage of horizontal output stage maintaining a constant duty cycle till the trailing edge of the output pulse gets the trailing edge of the flyback pulse. From this point on, only the leading edge of the output pulse will be shifted covering a total phase shift of: 0.30T; overcoming this value, it will produce a notch in the output pulse (@ $f_H = 27\text{kHz}$).

Technical note 5

The voltage reference at Pin 19 can be used to polarize the DC operating point of the vertical booster. This voltage corresponds to the double of the mean value voltage of the vertical sawtooth at Pin 13.

Technical note 6

$$\frac{V_H - V_L}{t_s} = \frac{V_H - V_{LL}}{1/f_V}$$

$$t_s = \frac{(V_H - V_L)}{(V_H - V_{LL})} \frac{1}{f_V} = \frac{K_{14}}{f_V}$$
