

LC²MOS Quad SPST Switches

ADG221/ADG222

FEATURES

- 44V Supply Maximum Rating
- ±15V Analog Signal Range
- Low R_{ON} (60Ω)
- Low Leakage (0.5nA)
- Break-Before-Make Switching
- Extended Plastic Temperature Range
(-40°C to +85°C)
- Low Power Dissipation (25.5mW)
- μP, TTL, CMOS Compatible
- Available in 16-Lead DIP/SOIC and
20-Lead PLCC/LCCC Packages
- Surface Mount Packages
- Superior DG221 Replacement

FUNCTIONAL BLOCK DIAGRAM

GENERAL DESCRIPTION

The ADG221 and ADG222 are monolithic CMOS devices comprising four independently selectable switches. On-chip latches facilitate microprocessor interfacing. They are designed on an enhanced LC²MOS process which gives an increased signal handling capability of ±15V. These switches also feature high switching speeds and low R_{ON}.

The ADG221 and ADG222 consist of four SPST switches. They differ only in that the digital control logic is inverted. All devices exhibit break before make switching action. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

PRODUCT HIGHLIGHTS

1. Easily Interfaced:
Digital inputs are latched with a \overline{WR} signal for microprocessor interfacing. A 5V regulated supply is internally generated permitting wider tolerances on the supplies without affecting the TTL digital input switching levels.
2. Single Supply Operation:
For applications where the analog signal is unipolar (0V to 15V), the switches can be operated from a single +15V supply.
3. Low Leakage:
Leakage currents in the range of 500pA make these switches suitable for high precision circuits. The added feature of Break-before-Make switching allows for multiple outputs to be tied together for multiplexer applications while keeping leakage errors to a minimum.

Lead Temperature (Soldering 10sec)	+300°C

NOTE

¹Overvoltage at IN, WR, S or D will be clamped by diodes. Current should be limited to the Maximum Rating above.

*COMMENT: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one Absolute Maximum Rating may be applied at

ADG221/ADG222

CAUTION

ESD (electrostatic discharge) sensitive device. The digital control inputs are diode protected; however, permanent damage may occur on unconnected devices subject to high energy electrostatic fields. Unused devices must be stored in conductive foam or shunts. The protective foam should be discharged to the destination socket before devices are removed.

TIMING AND CONTROL SEQUENCE

Figure 2 shows the timing sequence for latching the switch digital inputs (IN1 – IN4). The latches are level sensitive and, therefore, while \overline{WR} is held low the latches are transparent and the switches respond to the digital inputs. The digital inputs are latched on the rising edge of \overline{WR} .

TERMINOLOGY

R_{ON}	Ohmic resistance between terminals OUT and S
R_{ON} Match	Difference between the R_{ON} of any two channels
I_S (OFF)	Source terminal leakage current when the switch is off
I_D (OFF)	Drain terminal leakage current when the switch is off
I_D (ON)	Leakage current that flows from the closed switch into the body
V_D (V_S)	Analog voltage on terminal D, S
C_S (OFF)	Switch input capacitance "OFF" condition
C_D (OFF)	Switch output capacitance "OFF" condition
C_{IN}	Digital input capacitance
C_D, C_S (ON)	Input or output capacitance when the switch is on

t_{ON}	Delay time between the 50% and 90% points of the digital input and switch "ON" condition
t_{OFF}	Delay time between the 50% and 90% points of the digital input and switch "OFF" condition
t_{OPEN}	"OFF" time measured between 50% points of both switches, which are connected as a multiplexer, when switching from one address state to another
V_{INL}	Maximum Input Voltage for a Logic Low
V_{INH}	Minimum Input Voltage for a Logic High
I_{INL} (I_{INH})	Input current of the digital input
V_{DD}	Most positive voltage supply
V_{SS}	Most negative voltage supply
I_{DD}	Positive supply current
I_{SS}	Negative supply current
