

AME1086

1.5A Low Dropout Positive Voltage Regulator

■ General Description

The AME1086 is a 1.5A low-dropout positive voltage regulator. It is available in fixed and adjustable output voltage versions. Overcurrent and thermal protection are integrated onto the chip. Output current will limit as it reaches the pre-set current or temperature limit. At full rated output current the dropout voltage is 1.4V (max.). AME1086 series regulators provide excellent regulation over line, load and temperature variations.

■ Key Features

- Low dropout voltage 1.2V typically at 1.5A
- Adjustable or 3.3V fixed voltage
- Line regulation typically 0.015%
- Load regulation typically 0.05%
- Adjust pin (ADJ) current less than 90 μ A
- Overcurrent protection
- Thermal protection
- Available in TO-220, TO-263, TO-252

■ Applications

- High Efficiency Linear Regulators
- Post Regulators for Switching Supplies
- 5V to 3.3V Voltage Converter
- Battery Charger

■ Application Description

1. Output voltage adjustment

Like most regulators, the AME1086 regulates the output by comparing the output voltage to an internally generated reference voltage. On the adjustable version, the V_{REF} is available externally as 1.25V between V_{OUT} and ADJ. The voltage ratio formed by R_1 and R_2 should be set to conduct 10mA (minimum output load). The output voltage is given by the following equation:

$$V_{OUT} = V_{REF} \left(1 + \frac{R_2}{R_1} \right) + I_{ADJ} \times R_2$$

On fixed versions of AME1086, the voltage divider is provided internally.

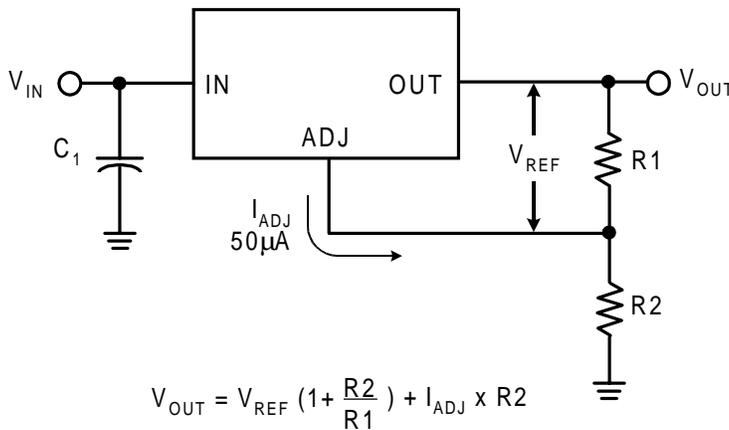

Figure 3

2. Thermal protection

AME1086 has thermal protection which limits junction temperature to 150°C. However, device functionality is only guaranteed to a maximum junction temperature of +125°C.

The power dissipation and junction temperature for AME1086 in TO-220 package are given by

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT}$$

$$T_{JUNCTION} = T_{AMBIENT} + (P_D \times \theta_{JA})$$

Note: $T_{JUNCTION}$ must not exceed 125°C

3. Current limit protection

AME1086 is protected against overload conditions. Current protection is triggered at typically 3.0A.

4. Stability and load regulation

AME1086 requires a capacitor from V_{OUT} to GND to provide compensation feedback to the internal gain stage. This is to ensure stability at the output terminal. Typically, a 10µF tantalum or 50µF aluminum electrolytic is sufficient.

Note: It is important that the ESR for this capacitor does not exceed 0.5Ω.

The output capacitor dose not have a theoretical upper limit and increasing its value will increase stability. $C_{OUT} = 100\mu F$ or more is typical for high current regulator design.

For the adjustable version, the best load regulation is accomplished when the top of the resistor divider (R_1) is connected directly to the output pin of the AME1086. When so connected, R_p is not multiplied by the divider ratio. For fixed output versions, the top of R_1 is internally connected to the output and ground pin can be connected to low side of the load.

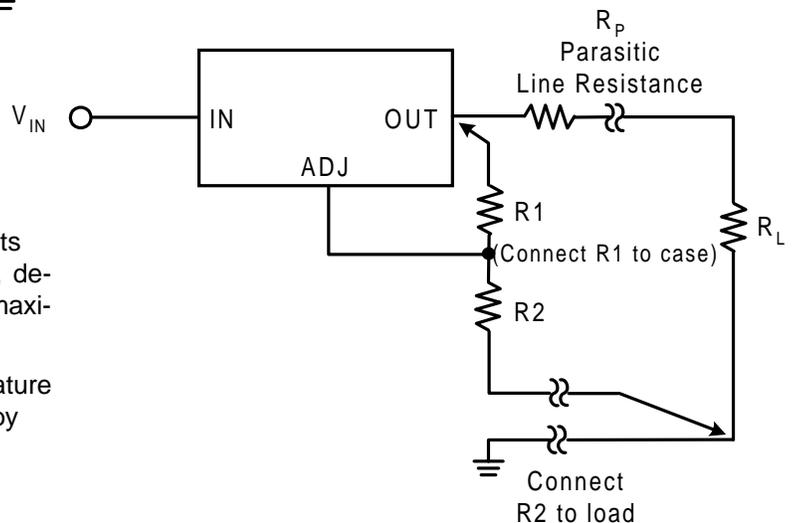

Figure 4

**1.5A Low Dropout
Positive Voltage Regulator**

5. Thermal consideration

The AME1086 series contain thermal limiting circuitry designed to protect itself for over-temperature conditions. Even for normal load conditions, maximum junction temperature ratings must not be exceeded. As mentioned in the thermal protection section, we need to consider all sources of thermal resistance between junction and ambient. It includes junction-to-case, case-to-heat-sink interface and heat sink thermal resistance itself.

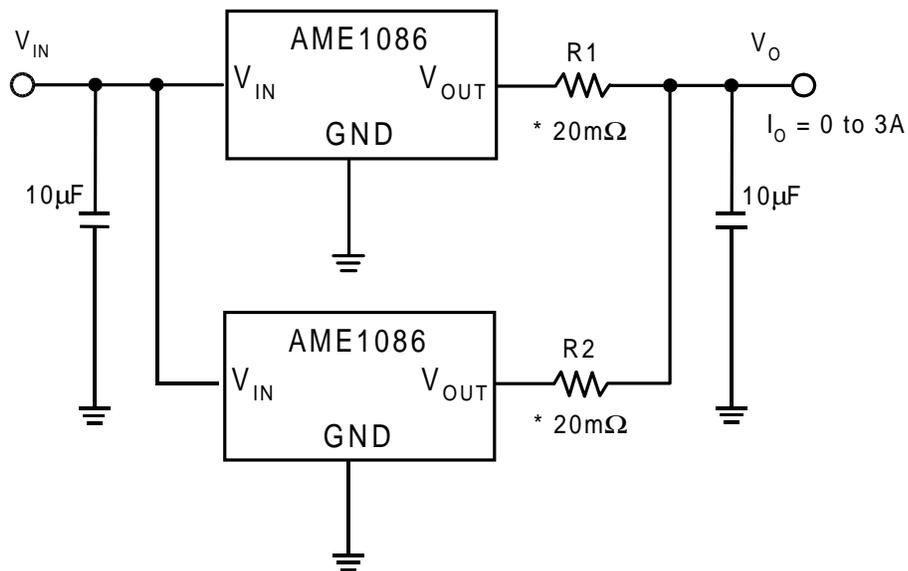

Junction-to-case thermal resistance is specified from the IC junction to the bottom of the case directly below the die. Proper mounting is required to ensure the best possible thermal flow from this area of the package to the heat sink. The case of all devices in this series is electrically connected to the output. Therefore, if the case of the device must be electrically isolated, a thermally conductive spacer is recommended.

■ Advanced Applications

$$* V_O = V_{REF} \left(1 + \frac{R2}{R1} \right) + I_{ADJ} \times R2$$

** Optional for improved ripple rejection

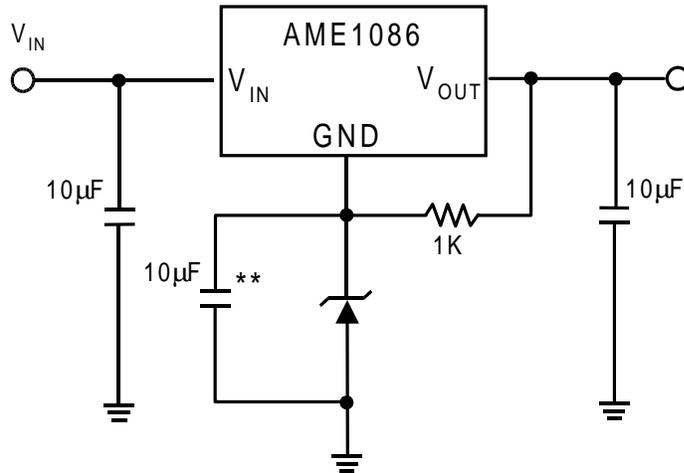

Figure 5 Adjustable output voltage

* 20mΩ is ballast resistance

The inter - connection of #18 wire could act as ballast resistance

Figure 6 Paralleling Regulators

■ Advanced Applications (Cont.)

* $V_O = V_{REF} + V_Z$ (V_Z : breakdown voltage of Zener diode)

** Optional for improved ripple rejection
