## Pre/Power Amplifier, Governor Single Chip IC for 3V Headphone Stereo

### ■ Description

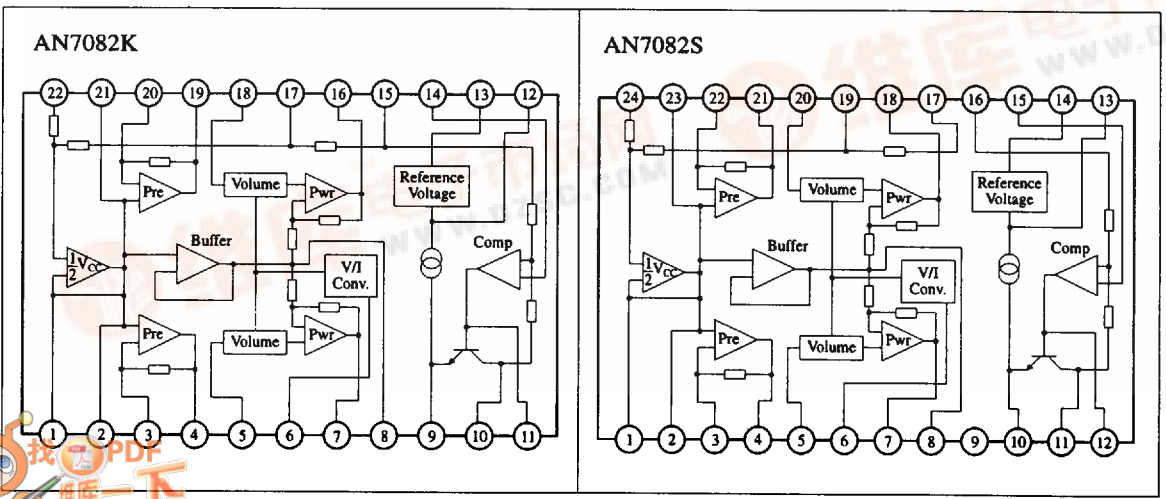

The AN7082K/S are the monolithic integrated circuits most suitable for stereo headphone cassette player with integrated pre-amp., power amp., motor governor into a single chip and built-in electronic VR.

### ■ Features

- Wide operating supply voltage range:  
 $V_{cc(opr)} = 1.8V \sim 6V$
- Fewer peripheral parts
- Both channel VR control by single string VR is possible due to electronic VR built-in
- Available for graphic equalizer

■ AN7082K Radio Application Circuit

Note: Resistors R11/R12 and diodes D1/D2 are used to mute pre-amp during radio mode.  
Resistor R13/R14 act as multiplexer load.  
Resistors R15/R16 are used to achieve same output level during radio/playback mode.

## ■ Application Notes

### 1. Tuner Connection

- a) AN7082K can be combined with any tuner IC to form 2-chip Headphone stereo player. This is possible by adding 2 resistors, R11/R12 & 2 diodes, D1/D2 to function as Pre-amp Mute circuit during Radio operation.
- b) During Tape playback mode R11/R12 & D1/D2 are being DC biased through Tape V<sub>CC</sub>, such that the Tape signal from Pre-amp output can pass through & be amplified by the subsequent power stage.
- c) During Radio Mode, V<sub>CC</sub> supply to R11/R12 & D1/D2 is cut off, causing D1/D2 to be inoperative. As such, any Pre-amp output signals from tape will be blocked by the diodes and will not contribute to radio noise.
- d) Values of R11/R12 are selected to be equal to that of Tuner MPX load. Values of R13/R14 are adjusted to achieve same output power level during tape playback & radio modes.

### 2. Motor Hum Noise

- a) To reduce output noise, add C7/C8 1000p between Pre NF pins & Pre-Out pins on both channels respectively.
- b) Where practical, the distance between Motor and AN7082K on PCB should be kept as far as possible, especially the orientation of Pre-amp input pins. This is to reduce Motor Hum Noise feedback through to AN7082K/S inputs.

- c) The PCB layout tracks from pin 10 and pin 13 to Motor(-) and Motor(+) terminals should also be maintained as far as possible from Pre-amp inputs pins to reduce motor interference.
- d) The motor assembly is preferably covered by some metal shield to reduce noise radiation of the unit.
