

## Features

- Temperature and Voltage Compensated Frequency (Fully Integrated Oscillator)
- Warning Indication of Lamp Failure by Means of Frequency Doubling
- Voltage Dependence of the Indicator Lamps also Compensated for Lamp Failure
- Relay Output with High Current Capability and Low Saturation Voltage
- Frequency Doubling only During Direction Mode
- Temperature Compensated Threshold for Lamp Failure Detection
- Overvoltage and Undervoltage Shut Down of the Relay Outputs
- Quiescent Current  $I \leq 10 \mu A$  (Switches Open)
- EMI Protection According to ISO TR 7637/1, Test Level 4 (Exclusive Load Dump)
- Reversed Battery Protection by Means of a Serial Resistor and Relay Coil Connected
- Load Dump Protection 80 V with External Protection Components
- 12 V/24 V Application
- Package: SO16

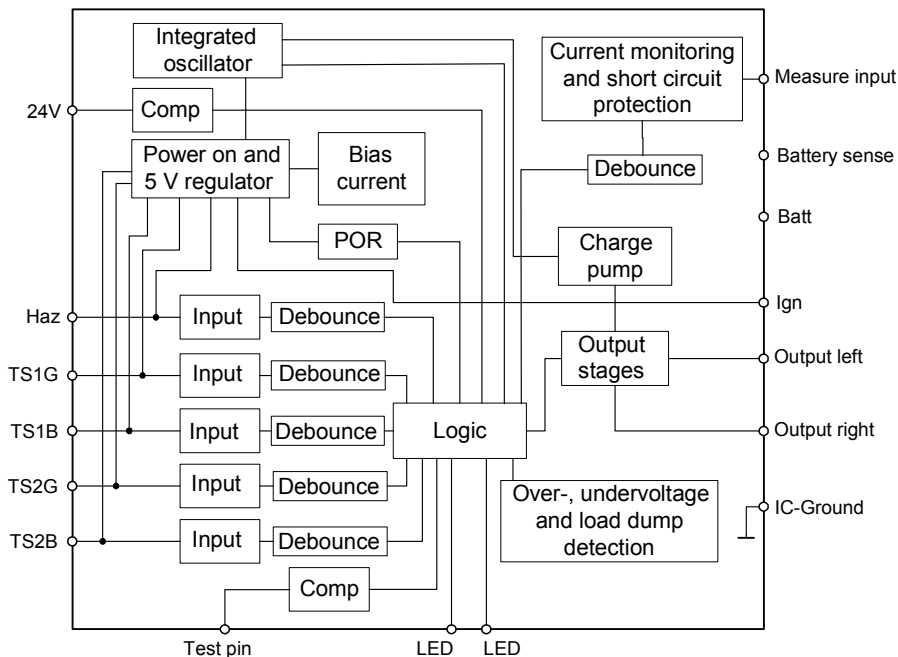

Electrostatic sensitive device.  
Observe precautions for handling.

## Description

The integrated circuit ATA6140 is used in relay-controlled automotive flashers. With two output stages, each side of the vehicle is controlled separately. A left and a right direction indicator input with only a small control current makes switch contacts for small loads possible. The separate hazard warning input simplifies the construction of the hazard switch. Lamp outage is indicated by frequency doubling during direction mode. Thanks to the extreme low current consumption the ATA6140 can be connected to the battery directly.

## Absolute Maximum Ratings

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Parameters	Symbol	Value	Unit
Supply voltage, pin 6	$V_{VS}$	6 to 40	V
Ambient temperature range	$T_{amb}$	-40 to +105	°C
Junction temperature range	$T_j$	-40 to +150	°C
Storage temperature range	$T_{stg}$	-55 to +150	°C

## Short Circuit or Overload Detection Delay

Direction mode:

100 ms during the first bright phase, 50 ms during all following bright phases

Hazard mode: 100 ms during all bright phases

In case of overload the relay output switches off (not stored)

## Bulb Outage Detection

The detection of bulb outage takes place during the bright phase. There is a delay time of typically 128 ms before ATA6140 measures the bulb current with a debounce period of 5 ms. After this time the inrush current dropped significantly.

Application hint:

It has to be considered that a slow relay contact may shorten the inrush current decay time and too high current would be measured and falsely an outage may not be detected. If operated with low supply voltage (e.g., 8 V) the relay speed could be even slower.

Notes: 1. x = no flashing

2. If ignition is OFF, the input level cannot be sensed (the IC is in the sleep mode). For hazard mode use the input hazard.

3. For hazard mode use input hazard or switch to battery as shown in Figure 6 on page 8 and Figure 10 on page 10.
