3-phase motor driver

BA6840BFS / BA6840BFP-Y / BA6840BFP / BA6842BFS

The BA6840BFS, BA6840BFP-Y, BA6840BFP, and BA6842BFS are one-chip ICs designed for driving CD-ROM motors. They are high performance-ICs with a 3-phase, full-wave, pseudo-linear drive system.

●Applications

CD-ROM / RW, DVD-ROM / PLAYER

●Features

1) 3-phase, full-wave, pseudo-linear drive system.
2) Start / stop pin; power saving during stop mode.
3) Internal current limit circuit.
4) Internal thermal shutdown circuit.
5) Internal hall bias circuit.

Operating temperature		Topr	−20～+75	℃
Storage temperature		Tstg	−55～+150	℃
Output current		I_{OUT}	1300	mA

*1 Reduced by 7.5 mW for each increase in Ta of 1℃ over 25℃.
*2 Reduced by 11.6 mW for each increase in Ta of 1℃ over 25℃.
*3 Reduced by 13.6 mW for each increase in Ta of 1℃ over 25℃.
*4 Reduced by 8.0 mW for each increase in Ta of 1℃ over 25℃.
*1～4 When mounted on a 90×50×1.6 mm glass epoxy board.
Should not exceed Pd or ASO values.

●Circuit operation

(1) Hall input ~ output

The 3-phase Hall signal is amplified in the hall amplifiers and sent to the matrix section, where the signal is further amplified and combined. After the signal is converted to a current in the amplitude control circuit, the current is supplied to the output driver, which then provides a motor drive current. The phases of the Hall input signal, output voltage, and output current are shown in Fig. 5.

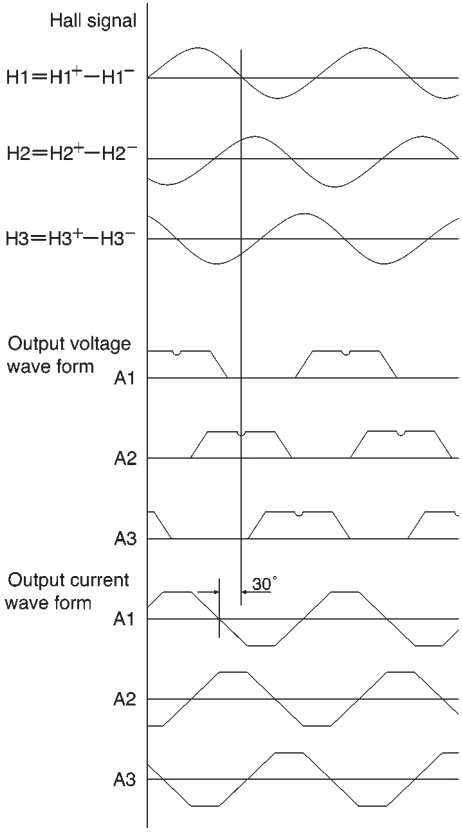

Fig. 5

(2) Torque control pin

The R_{NF}-pin current depends on the torque control input voltage (EC) as shown in Fig. 6.

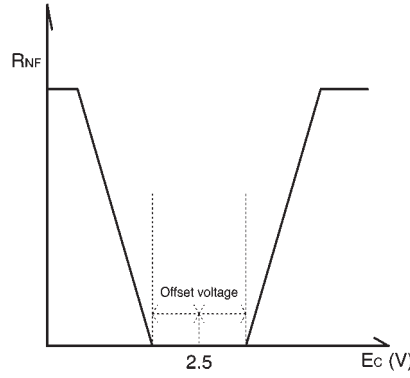

Fig. 6

	Reverse pin voltage	
	H	L
$E_{CR} < Ec$	Reverse	Forward
$E_{CR} > Ec$	Stop	Reverse

(3) Start / stop pin

The motor is in the run mode when the pin input voltage is 3.5V or more, and in the idle mode (all output transistors are off) when the voltage is 1.5V or less.

(4) Power ground pin (R_{NF} pin)

The R_{NF} pin is the output stage ground pin. Connect a resistor (0.5Ω recommended) between this pin and the ground to monitor the output current.

(5) Phase compensation pin (C_{NF} pin)

Connect and adjust a capacitor between this pin and the ground if the output tends to oscillate.

●Operation notes

(1) Start / stop

The I / O equivalent circuit of the start / stop pin is shown in Fig. 7. The pin has a temperature dependence of −7mV / °C, and the resistance can vary ±30%. Take the temperature effect into consideration when designing your application.

(2) Hall input

The Hall input equivalent circuit is shown in Fig. 12. The Hall devices can be connected in either series or parallel.

(3) Thermal shutdown circuit (TSD)

The circuit puts the coil outputs (A_1, A_2, and A_3) to the open state at the temperature of 175°C (typical). There is a temperature difference of about 15°C between the temperatures at which the circuit is activated and deactivated.
