Switching regulator for DC / DC Converters

BA9700A / BA9700AF / BA9700AFV

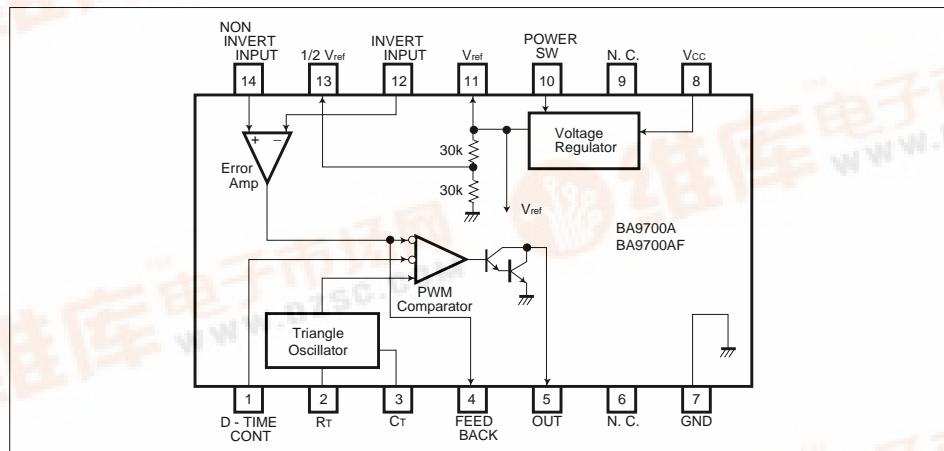

The BA9700A, BA9700AF and BA9700AFV are switching regulators that use a pulse width modulation (PWM) system. They use a transistor switch to stabilize the output voltage.

By the use of the transistor, power loss is decreased, fluctuation efficiency is improved, and the circuit is made more compact and single.

●Features

- 1) Output voltage can step up, step down, or invert at an arbitrary level.
- 2) Low current consumption. (typically 1.7mA)
- 3) Wide oscillation frequency range.
(typically 2.8k ~ 470kHz)
- 4) Built-in reference voltage current. (typically 2.57V)
- 5) Operates at low voltage. (minimally 3.55V)
- 6) Dead time controller restricts operation when overloaded.
- 7) Power switch can isolate all circuits in the IC.
- 8) Best suited for battery operated equipment.
- 9) Compact 14-pin SSOP package (BA9700AFV).
