●Operation notes

(1) When the MUTE pin voltage reaches 1.5V or higher, the output voltage is muted and the bias level is output.

(2) Frequency characteristics can be changed by adjusting the capacitor attached to pin 3 (20 pin) or pin 5 (18 pin).

(3) Gain can be changed by attaching a resistor to pin 4 (19 pin).

(4) Attach a transistor to pin 7 (16 pin) to mute popping sounds. Recommended transistor: 2SD1781K

(5) The reset block idling power supply for pin 15 should be left on as it prevents popping sounds.

(6) To prevent popping sounds due to sudden fluctuation in the power supply voltage, attach a ripple filter.

(7) To prevent popping sounds due to sudden changes in the mute pin voltage, connect pin 8 to 1μF (approx.) capacitor.

(8) Attach a by-pass capacitor (approx. 0.1μF) at the base of the IC between the power supply.
